1. Construction

The **NSK** bearing unit is a combination of a radial ball bearing, seal, and a housing of high-grade cast iron or pressed steel, which comes in various shapes.

The outer surface of the bearing and the internal surface of the housing are spherical, so that the unit is self-aligning.

The inside construction of the ball bearing for the unit is such that steel balls and retainers of the same type as in series 62 and 63 of the deep groove ball bearing are used. A duplex seal consisting of a combination of an oil-proof synthetic rubber seal and a slinger is

provided on both sides.

Depending on the type, the following methods of fitting to the shaft are employed:

- (1) The inner ring is fastened onto the shaft in two places by set screws.
- (2) The inner ring has a tapered bore and is fitted to the shaft by means of an adapter.
- (3) In the eccentric locking collar system the inner ring is fastened to the shaft by means of eccentric grooves provided at the side of the inner ring and on the collar.

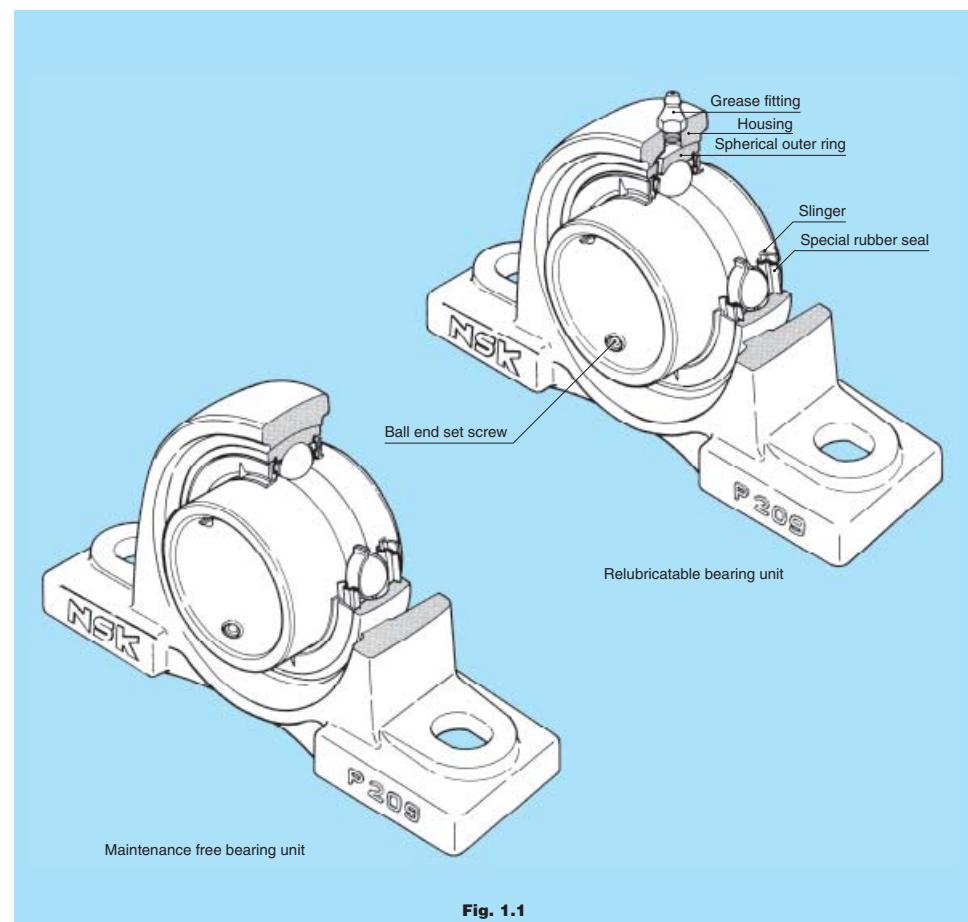

Fig. 1.1

2. Design Features and Advantages

2.1 Maintenance free type

The **NSK** Maintenance free bearing unit contains a high-grade lithium-based grease, good for use over a long period, which is ideally suited to sealed-type bearings. Also provided is an excellent sealing device, which prevents any leakage of grease or penetration of dust and water from outside.

It is designed so that the rotation of the shaft causes the sealed-in grease to circulate through the inside space, effectively providing maximum lubrication. The lubrication effect is maintained over a long period with no need for replenishment of grease.

To summarize the advantages of the **NSK** maintenance free bearing unit:

- (1) As an adequate amount of good quality grease is sealed in at the time of manufacture, there is no need for replenishment. This means savings in terms of time and maintenance costs.
- (2) Since there is no need for any regreasing facilities, such as piping, a more compact design is possible.
- (3) The sealed-in design eliminates the possibility of grease leakage, which could lead to stained products.

2.2 Relubricatable type

The **NSK** relubricatable type bearing unit has an advantage over other similar units being so designed as to permit regreasing even in the case of misalignment of 2° to the right or left. The hole through which the grease fitting is mounted usually causes structural weakening of the housing.

However, as a result of extensive testing, in the **NSK** bearing unit the hole is positioned so as to minimize this adverse effect. In addition, the regreasing groove has been designed to minimize weakening of the housing.

While the **NSK** maintenance free type bearing unit is satisfactory for use under normal operating conditions in-doors, in the following circumstances it is necessary to use the relubricatable type bearing unit:

- (1) Cases where the temperature of the bearing rises above 100°C, 212°F:
*Normal temperature of up to 130°C, 266°F heat-resistant bearing units.
- (2) Cases where there is excessive dust, but space does not permit using a bearing unit with a cover.
- (3) Cases where the bearing unit is constantly exposed to splashes of water or any other liquid, but space does not permit using a bearing unit with a cover.
- (4) Cases in which the humidity is very high, and the machine in which the bearing unit is used is run

only intermittently.

- (5) Cases involving a heavy load of which the C/P , value is about 10 or below, and the speed is 10 min⁻¹ or below, or the movement is oscillatory.
- (6) Cases where the number of revolutions is relatively high and the noise problem has to be considered; for example, when the bearing is used with the fan of an air conditioner.

2.3 Special sealing feature

2.3.1 Standard bearing units

The sealing device of the ball bearing for the **NSK** bearing unit is a combination of a heat-resistant and oil-proof synthetic rubber seal and a slinger of an exclusive design.

The seal, which is fixed in the outer ring, is steel-reinforced, and its lip, in contact with the inner ring, is designed to minimize frictional torque.

The slinger is fixed to the inner ring of the bearing with which it rotates. There is a small clearance between its periphery and the outer ring.

These two types of seals on both sides of the bearing prevent grease leakage, and foreign matter is prevented from entering the bearing from outside.

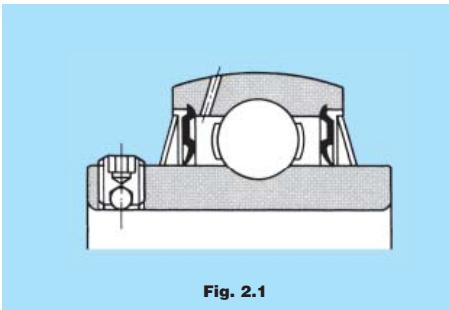

Fig. 2.1

2.3.2 Bearing units with covers

The **NSK** bearing unit with a cover consists of a standard bearing unit and an outside covering for extra protection against dust. Special consideration has been given to its design with respect to dust-proofing.

Sealing devices are provided in both the bearing and the housing, so that units of this type operate satisfactorily even in such adverse environments as flour mills, steel mills, foundries, galvanizing plants and chemical plants, where excessive dust is produced and/or liquids are used. They are also eminently suitable for outdoor environments where dust and rain are inevitable, and in heavy industrial machinery such as construction and transportation equipment.

The rubber seal of the cover contacts with the shaft by its two lips, as shown in Fig. 2.2 and 2.3. By filling the groove between the two lips with grease, an excellent sealing effect is obtained and, at the same time, the contacting portions of the lips are lubricated. Furthermore, the groove is so designed that when the shaft is inclined the rubber seal can move in the radial direction.

When bearing units are exposed to splashes of water rather than to dust, a drain hole (5 to 8 mm, 0.2 to 0.3 inches in diameter) is provided at the bottom of the cover, and grease should be applied to the side of the bearing itself instead of into the cover.

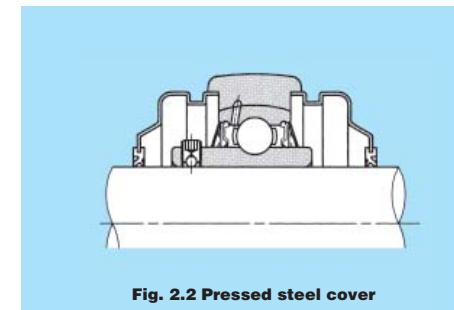

Fig. 2.2 Pressed steel cover

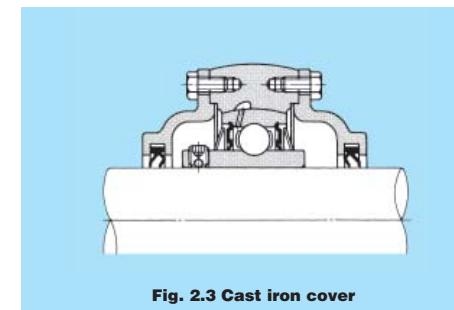

Fig. 2.3 Cast iron cover

2.4 Secure fitting

Fastening the bearing to the shaft is effected by tightening the ball-end set screw, situated on the inner ring. This is a unique feature which prevents loosening, even if the bearing is subjected to intense vibrations and shocks.

2.5 Self-aligning

With the **NSK** bearing unit, the outer surface of the ball bearing and the inner surface of the housing are spherical, thus this bearing unit has self-aligning characteristic. Any misalignment of axis that may arise from poor workmanship on the shaft or errors in fitting will be properly adjusted.

2.6 Higher rated load capacity

The bearing used in the unit is of the same internal construction as those in bearing series 62 and 63, and is capable of accommodating axial load as well as radial load, or composite load. The rated load capacity of this bearing is considerably higher than that of the corresponding self-aligning ball bearings used for standard plummer blocks.

2.7 Light weight yet strong housing

Housings for **NSK** bearing units come in various shapes. They consist of either high-grade cast iron, one-piece casting, or of precision finished pressed steel, the latter being lighter in weight. In either case, they are practically designed to combine lightness with maximum strength.

2.8 Easy mounting

The **NSK** bearing unit is an integrated unit consisting of a bearing and a housing.

As the bearing is prelubricated at manufacture with the correct amount of high-grade lithium base, it can be mounted on the shaft just as it is. It is sufficient to carry out a short test run after mounting.

2.9 Accurate fitting of the housing

In order to simplify the fitting of the pillow block and flange type bearing units, the housings are provided with a seat for a dowel pin, which may be utilized as needed.

2.10 Bearing replaceability

The bearing used in the **NSK** bearing unit is replaceable. In the event of bearing failure, a new bearing can be fitted to the existing housing.

3. Tolerance

The tolerances of the NSK bearing units are in accordance with the following JIS specifications:

3.1 Tolerances of ball bearings for the unit

The tolerances of ball bearings used in the unit are shown in the following tables, 3.1 to 3.4.

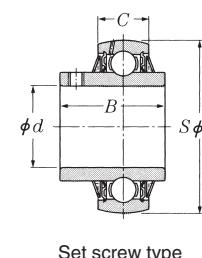

Table 3.1 (1) Cylindrical bore (UC, UCS, AS, ASS, UEL, UELS, AEL, AELS)

| | | +20 | 0 | +14 | -6 | +6 | -14 | | | | |

Remarks 1. Symbols

Δ_{Damp} : Mean spherical bore diameter deviation

2. Dimensional tolerances for spherical bore diameter of housing are classified as H7 for clearance fit, and J7 for intermediate fit.

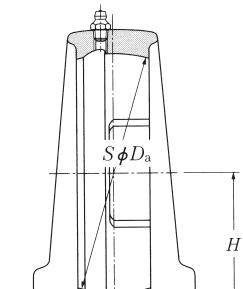

3. Spherical bore diameter of housings are finished by following tolerance classes such as 52mm or less : K7, over 52mm and 180mm or less : J7, and over 180mm : H7 respectively.

Table 3.6 Pillow block housings (P, PL, HP, UP)

Remarks 1. H is the outside diameter of cartridge housings.

2. A is width of cartridge housings.

4. Basic Load Rating and Life

4.1 Bearing life

Even in bearings operating under normal conditions, the surfaces of the raceway and rolling elements are constantly being subjected to repeated compressive stresses which cause flaking of these surfaces to occur. This flaking is due to material fatigue and will eventually cause the bearings to fail. The effective life of a bearing is usually defined in terms of the total number of revolutions a bearing can undergo before flaking of either the raceway surface or the rolling element surfaces occurs.

Other causes of bearing failure are often attributed to problems such as seizing, abrasions, cracking, chipping, gnawing, rust, etc. However, these so called "causes" of bearing failure are usually themselves caused by improper installation, insufficient or improper lubrication, faulty sealing or inaccurate bearing selection. Since the above mentioned "cause" of bearing failure can be avoided by taking the proper precautions, and are not simply caused by material fatigue, they are considered separately from the flaking aspect.

4.2 Basic rated life and basic dynamic load rating

A group of seemingly identical bearings when subjected to identical load and operating conditions will exhibit a wide diversity in their durability.

This "life" disparity can be accounted for by the difference in the fatigue of the bearing material itself. This disparity is considered statistically when calculating bearing life, and the basic rated life is defined as follows.

The basic rated life is based on a 90% statistical model which is expressed as the total number of revolutions 90% of the bearings, in an identical group of bearings subjected to identical operating conditions, will attain or surpass before flaking due to material fatigue occurs. For bearings operating at fixed constant speeds, the basic rated life (90% reliability) is expressed in the total number of hours of operation.

The basic dynamic load rating is an expression of the load capacity of a bearing based on a constant load which the bearing can sustain for one million revolutions (the basic life rating). For radial bearings this rating applies to pure radial loads, and for thrust bearings it refers to pure axial loads. The basic dynamic load ratings given in the bearing tables of this catalog are for bearings constructed of standard bearing materials, using standard manufacturing techniques. Please consult **NSK** for basic load ratings of bearings constructed of special materials or using special

manufacturing techniques.

The relationship between the basic rated life, the basic dynamic load rating and the bearing load is given in formula (4.1).

$$L_{10} = \left(\frac{C_r}{P_r} \right)^3 \quad (4.1)$$

where,

L_{10} : Basic rated life 10^6 revolutions

C_r : Basic dynamic rated load, N, lbf

P_r : Equivalent dynamic load, N, lbf

The basic rated life can also be expressed in terms of hours of operation (revolution), and is calculated as shown in formula (4.2).

$$L_{10h} = 500 f_h^3 \quad (4.2)$$

$$f_h = f_n \frac{C_r}{P_r} \quad (4.3)$$

$$f_n = \left(\frac{33.3}{n} \right)^{1/3} \quad (4.4)$$

where,

L_{10h} : Basic rated life, h

f_h : Life factor

f_n : Speed factor

n : Rotational speed, min⁻¹

Formula (4.2) can also be expressed as shown in formula (4.5).

$$L_{10h} = \frac{10^6}{60n} \left(\frac{C_r}{P_r} \right)^3 \quad (4.5)$$

The relation between rotational speed n and speed factor f_n as well as the relation between the basic rated life L_{10h} and the life factor f_h is shown in Fig. 4.1.

When several bearings are incorporated in machines or equipment as complete units, all the bearings in the unit are considered as a whole when computing bearing life (see formula 4.6). The total bearing life of the unit is a life rating based on the viable lifetime of the unit before even one of the bearings fails due to rolling contact fatigue.

$$L = \frac{1}{\left(\frac{1}{L_1^{1.1}} + \frac{1}{L_2^{1.1}} + \dots + \frac{1}{L_n^{1.1}}\right)^{1/1.1}} \quad \dots \dots \dots (4.6)$$

where,

L : Total life of the whole bearing assembly,h

L_1, L_2, \dots, L_n : Rated life of bearings 1, 2, ..., n, h

In the case where load and the number of revolutions change at regulated intervals, after finding the rated life L_1, L_2, \dots, L_n under conditions of $n_1, P_1; n_2, P_2; \dots, n_n, P_n$; the built-in life L_m can be given by the formula (4.7).

$$L_1 = \frac{10^6}{60n_1} \left(\frac{C_r}{P_1} \right)^3$$

$$L_2 = \frac{10^6}{60n_2} \left(\frac{C_r}{P_1} \right)^3$$

⋮

$$L_n = \frac{10^6}{60n_n} \left(\frac{C_r}{P_1} \right)^3$$

$$L_m = \left(\frac{\phi_1}{L_1} + \frac{\phi_2}{L_2} + \dots + \frac{\phi_n}{L_n} \right)^{-1} \quad \dots \dots \dots (4.7)$$

where,

L_1, L_2, \dots, L_n : Rated life under condition 1, 2, ..., n, h

n_1, n_2, \dots, n_n : Number of revolutions under condition 1, 2, ..., n, min⁻¹

P_1, P_2, \dots, P_n : Equivalent load under condition 1, 2, ..., n, N, lbf

$\phi_1, \phi_2, \dots, \phi_n$: Ratio of condition 1, 2, ..., n accounting for the total operating time

L_m : Built-in life, h

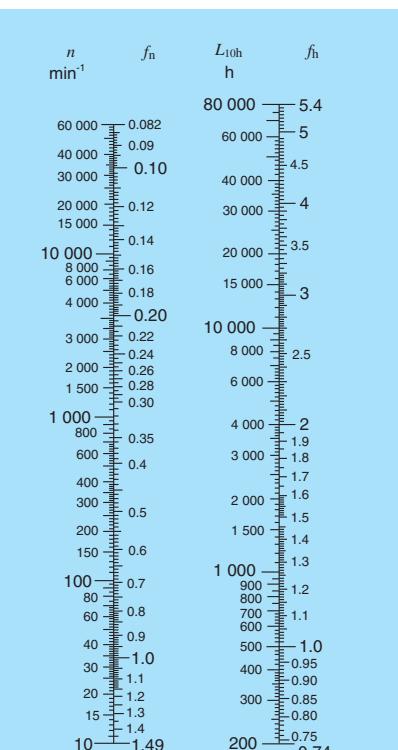

Fig. 4.1 Bearing life rating scale

Table 4.1 Rating life for applications

| Service classification | Machine application | Life time L_m |
|---|--|--------------------|
| Machines used occasionally | Door mechanisms, Garage shutter | 500 |
| Equipment for short period or intermittent service-interruption permissible | Household appliances, Electric hand tools, Agricultural machines, Lifting tackles in shops | 4 000 to 8 000 |
| Intermittent service machines-high reliability | Power-Station auxiliary equipment, Elevators, Conveyors, Deck cranes | 8 000 to 14 000 |
| Machines used for 8 hours a day, but not always in full operation | Ore wagon axles, important gear units | 14 000 to 20 000 |
| Machines fully used for 8 hours | Blowers, General machinery in shops, Continuous operation cranes | 20 000 to 30 000 |
| Machines continuously used for 24 hours a day | Compressors, Pumps | 50 000 to 60 000 |
| Machines continuously used for 24 hours a day with maximum reliability | Power-station equipment, Water-supply equipment for urban areas, Mine ventilators | 100 000 to 200 000 |

4.3 Basic static load rating

When stationary rolling bearings are subjected to static loads, they suffer from partial permanent deformation of the contact surfaces at the contact point between the rolling elements and the raceway. The amount of deformity increases as the load increases, and if this increase in load exceeds certain limits, the subsequent smooth operation of the bearing is impaired.

It has been found through experience that a permanent deformity of 0.0001 times the diameter of the rolling element, occurring at the most heavily stressed contact point between the raceway and the rolling elements, can be tolerated without any impairment in running efficiency.

The basic rated static load refers to a fixed static load limit at which a specified amount of permanent deformation occurs. It applies to pure radial loads for radial bearings. The maximum applied load values for contact stress occurring at the rolling element and raceway contact points are given below.

For ball bearings (for bearing unit): 4 200 MPa

4.4 Allowable static equivalent load

Generally the static equivalent load which can be permitted is limited by the basic static rated load as stated in Section 4.3. However, depending on requirements regarding friction and smooth operation, these limits may be greater or lesser than the basic static rated load.

In the following formula (4.8) and Table 4.2 the safety factor S_0 can be determined considering the maximum static equivalent load.

$$S_0 = \frac{C_0}{P_{0 \max}} \quad \dots \dots \dots (4.8)$$

where,

S_0 : Safety factor

C_0 : Basic static rated load, N, lbf

$P_{0 \max}$: Maximum static equivalent load, N, lbf

Table 4.2 Minimum safety factor values S_0

| Operating conditions | Ball bearings |
|---|---------------|
| High rotational accuracy demand | 2 |
| Normal rotating accuracy demand (Universal application) | 1 |
| Slight rotational accuracy deterioration permitted (Lcw speed, heavy loading, etc.) | 0.5 |

Remarks When vibration and/or shock loads are present, a load factor based on the shock load needs to be included in the $P_{0 \max}$ value.

5. Bearing Internal Clearance

5.1 Bearing internal clearance

Bearing internal clearance (initial clearance) is the amount of internal clearance a bearing has before being installed on a shaft or in a housing.

As shown in Fig. 5.1, when either the inner ring or the outer ring is fixed and the other ring is free to move, displacement can take place in either an axial or radial direction. This amount of displacement (radially or axially) is termed the internal clearance and, depending on the direction, is called the radial internal clearance or the axial internal clearance.

When the internal clearance of a bearing is measured, a slight measurement load is applied to the raceway so the internal clearance may be measured accurately. However, at this time, a slight amount of elastic deformation of the bearing occurs under the measurement load, and the clearance measurement value (measured clearance) is slightly larger than the true clearance. This discrepancy between the true bearing clearance and the increased amount due to the elastic deformation must be compensated for. These compensation values are given in Table 5.1.

The internal clearance values for each bearing class are shown in Tables 5.3.

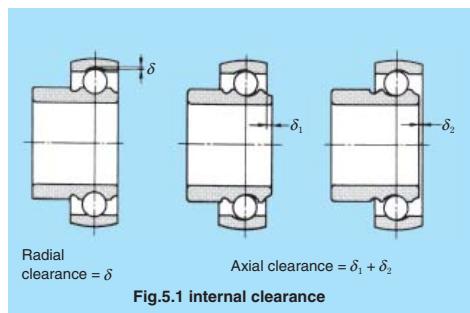

Fig.5.1 internal clearance

Table 5.1 Adjustment of radial internal clearance based on measured load
Unit μm

| Nominal Bore Diameter d (mm) | Measuring Load (N) | Radial Clearance Increase | | | | |
|--------------------------------|--------------------|---------------------------|----|----|----|----|
| | | C2 | CN | C3 | C4 | C5 |
| 10 18 | 24.5 | 3 to 4 | 4 | 4 | 4 | 4 |
| 18 50 | 49 | 4 to 5 | 5 | 6 | 6 | 6 |
| 50 200 | 147 | 6 to 8 | 8 | 9 | 9 | 9 |

5.2 Internal clearance selection

The internal clearance of a bearing under operating conditions (effective clearance) is usually smaller than the same bearing's initial clearance before being installed and operated. This is due to several factors including bearing fit, the difference in temperature between the inner and outer rings, etc. As a bearing's operating clearance has an effect on bearing life, heat generation, vibration, noise, etc.; care must be taken in selecting the most suitable operating clearance.

Effective internal clearance:

The internal clearance differential between the initial clearance and the operating (effective) clearance (the amount of clearance reduction caused by interference fits, or clearance variation due to the temperature difference between the inner and outer rings) can be calculated by the following formula:

$$\delta_{\text{eff}} = \delta_0 - (\delta_f + \delta_t) \quad \dots \quad (5.1)$$

where,

δ_{eff} : Effective internal clearance, mm

δ_0 : Bearing internal clearance, mm

δ_f : Reduced amount of clearance due to interference, mm

δ_t : Reduced amount of clearance due to temperature differential of inner and outer rings, mm

Reduced clearance due to interference:

When bearings are installed with interference fits on shafts and in housings, the inner ring will expand and the outer ring will contract; thus reducing the bearings' internal clearance. The amount of expansion or contraction varies depending on the shape of the bearing, the shape of the shaft or housing, dimensions of the respective parts, and the type of materials used. The differential can range from approximately 70% to 90% of the effective interference.

$$\delta_f = (0.70 \text{ to } 0.90) \cdot \Delta d_{\text{eff}} \quad \dots \quad (5.2)$$

where,

δ_f : Reduced amount of clearance due to interference, mm

Δd_{eff} : Effective interference, mm

Reduced internal clearance due to inner/outer ring temperature difference:

During operation, normally the outer ring will be from 5° to 10°C cooler than the inner ring or rotating parts. However, if the cooling effect of the housing is large,

the shaft is connected to a heat source, or a heated substance is conducted through the hollow shaft; the temperature difference between the two rings can be even greater. The amount of internal clearance is thus further reduced by the differential expansion of the two rings.

$$\delta_t = \alpha \cdot \Delta T \cdot D_o \quad \dots \quad (5.3)$$

where,

δ_t : Amount of reduced clearance due to heat differential, mm

α : Bearing steel linear expansion coefficient $12.5 \times 10^{-6}/^\circ\text{C}$

ΔT : Inner/outer ring temperature differential, °C

D_o : Outer ring raceway diameter, mm

Outer ring raceway diameter, D_o , values can be approximated by using formula 5.4.

For ball bearings,

$$D_o = 0.20(d+4.0D) \quad \dots \quad (5.4)$$

where,

d : Bearing bore diameter, mm

D : Bearing outside diameter, mm

5.3 Bearing internal clearance selection standards

Theoretically, in regard to bearing life, the optimum operating internal clearance for any bearing would be a slight negative clearance after the bearing had reached normal operating temperature.

Unfortunately, under actual operating conditions, maintaining such optimum tolerances is often difficult at best. Due to various fluctuating operating conditions this slight minus clearance can quickly become a large minus, greatly lowering the life of the bearing and causing excessive heat to be generated. Therefore, an initial internal clearance which will result in a slightly greater than negative internal operating clearance should be selected.

Under normal operating conditions (e.g. normal load, fit, speed, temperature, etc.), a standard internal clearance will give a very satisfactory operating clearance.

Table 5.2 lists non-standard clearance recommendations for various applications and operating conditions.

Table 5.2 Examples of applications where bearing clearances other than normal clearance are used

| Operating conditions | Applications | Selected clearance |
|---|---------------------------------------|--------------------|
| Shaft is heated and housing is cooled. | Conveyor of casting machine | C5 |
| Shaft or inner ring is heated. | Annealing pit, Drying pit, Curing pit | C4 |
| Allows for shaft deflection and fitting errors. | Disc harrows | C4 |
| | Combines | C3 |
| Tight-fitted for both inner and outer rings. | Large blowers | C3 |
| To reduce noise and vibration when rotating. | Multi-wing fan of air conditioners | C2 |

6.Lubrication

As bearings in NSK bearing units have sufficient high-grade grease sealed in at the time of manufacture, there is no need for replenishment while in use. The amount of grease necessary for lubrication is, in general, very small. With the NSK bearing units, the amount of grease occupies about a half to a third of the space inside the bearing.

6.1 Maximum permissible speed of rotation

The maximum speed possible while ensuring the safety and long life of ball bearings used in the unit is limited by their size, the circumferential speed at the point where the seal comes into contact, and the load acting on them.

To indicate the maximum speed permissible, it is customary to use the value of dn or $d_m n$ (d is the bore of the bearing; d_m is the diameter of the pitch circle = $(D+O.D.)/2$; n is the number of revolutions).

Problem connected with the lubrication of bearings are the generation of heat and seizures occurring at the sliding parts inside the bearing, in particular at the points where the ball is in contact with the retainer, inner and outer rings. The contact pressure at the points where friction occurs on the retainer is only

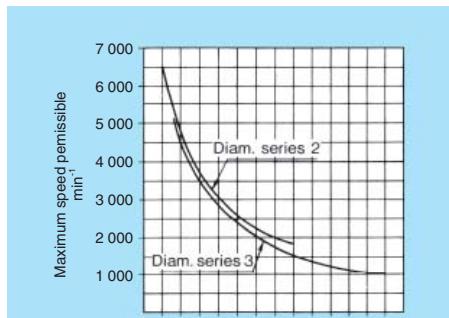

Fig. 6.1

slightly affected by the load acting on the bearing; the amount of heat generated there is approximately in proportion to the sliding velocity. Therefore, this sliding velocity serves as a yardstick to measure the limit of the rotating speed of the bearing. In the case of a bearing unit, however, there is another large factor that has to be taken into account—the circumferential speed at the part where the seal is in contact.

The graph in Fig.6.1 indicates the maximum speed of rotation permissible, taking into account the aforementioned factors.

There are two common methods of locking the bearing unit onto the shaft—the set screw system and the eccentric collar system. However, in both of these systems high-speed operation will cause deformation of the inner ring, which may result in vibration of the bearing. For high-speed operation, therefore, it is recommended that an interference fit or a clearance fit with a near-zero clearance be used.

For standard bearing units with the contact type seal, the maximum speed permissible is $120\ 000/d$. Where a higher speed is required, bearing units with the non-contact type seal, are advised. Please contact NSK regarding the use of the latter type. Additionally, it is necessary that the surface on which the housing is mounted be finished to as a high a degree of accuracy as possible. A regularity of within $\pm 0.05\text{mm}$, $\pm 0.002\text{inch}$ is required.

6.2 Replenishment of grease

6.2.1 Sealed-in grease

With NSK bearing units, no relubrication is the general rule. The standard self-lubricating type of bearing units contain high-grade lithium-based grease which, being suitable for long-term use, is ideal for sealed-type bearings. Relubrication, therefore, is unnecessary under most operating conditions.

At high temperatures, or where there is exposure to water or excessive dust, the highest quality grease is essential. Therefore, NSK uses its own specially selected brands which are shown in Table 6.1. It is necessary to use the same brand when replenishing grease.

Table 6.1 Brands of grease used in NSK bearing units

| Bearing units | Grease | | | Symbols | Operating temperature range °C, °F |
|----------------|-------------------|------------------|--------------|---------|---------------------------------------|
| | Name of grease | Thickening agent | Base oil | | |
| Standard | Alvania grease S3 | Li soap | Mineral oil | D1 | -10°C to +100°C, (+14°F to +212°F). |
| Heat-resistant | SH44MT | Li soap | Silicone oil | HT2D1 | Normal temp. to +130°C (266°F). |
| Cold-resistant | SH33L | Li soap | Silicone oil | CT1D1 | -60°C (-76°F) to normal temp. |

6.2.2 Mixing of different kinds of grease

Whether or not different kinds of grease may be mixed usually depends on their thickeners. The commonly used criteria are shown in Table 6.2. Properties which are most susceptible to influences from mixing are viscosity, dropping point and penetration. Water and heat resisting properties as well as mechanical stability are also lowered. Therefore, when mixing in a grease which is different to that which is already in use, it is essential that the thickener (soap base) and the base oil be of the same group.

When relubricating **NSK** bearing units, it is advisable to use the brands of grease shown in Table 6.1

Table 6.2 Mixing properties of grease

| Soap base | Ca | Na | Al | Ba | Li |
|-----------|----|----|----|----|----|
| Ca | O | △ | △ | × | △ |
| Na | △ | O | △ | × | × |
| Al | △ | △ | O | × | × |
| Ba | × | × | × | O | × |
| Li | △ | × | × | × | O |

O Mixing will not produce any appreciable change of properties.

△ Mixing may produce considerable variations of properties.

×

 Mixing will cause a drastic change of properties.

6.2.3 Relubrication frequency

Relubrication frequency varies with the kind and quality of grease used as well as the operating conditions. Therefore, it is difficult to establish a general rule, but under ordinary operating conditions, it is desirable that grease be replenished before one third (1/3) of its calculated life elapses. It is necessary, however, to take into consideration such factors as hardening of grease in the oil hole, making replenishment impossible; deterioration of grease while operation of the machine is suspended, and so forth.

In Table 6.3 below are shown standard relubrication frequencies. Irrespective of the calculated life of the grease, this list takes into consideration such factors as the rotational speed of the bearings, operating temperatures and environmental conditions, with a view to safety.

6.2.4 Re-greasing

The performance of a bearing is greatly influenced by the quantity of grease. In order to avoid over-filling, it is advisable to replenish the grease while the machine is in operation.

Continue to insert grease until a little oozes out from between the outer ring raceway and the periphery of the slinger, for optimum performance.

Table 6.3 Standard relubrication frequencies

| Type of unit | Symbol | dn Value | Environmental conditions | Operating temp. °C, °F | Relubrication frequency | |
|----------------|--------|------------------|---------------------------|----------------------------|-------------------------|----------------|
| | | | | | Hours | Period |
| Standard | D1 | 40 000 and below | Ordinary | -10 to +80, +14 to +176 | 1 500 to 3 000 | 6 to 12 mo. |
| Standard | D1 | 70 000 and below | Ordinary | -10 to +80, +14 to +176 | 1 000 to 2 000 | 3 to 6 mo. |
| Standard | D1 | 70 000 and below | Ordinary | +80 to +100, +176 to +212 | 500 to 700 | 1 mo. |
| Heat-resistant | HT2D1 | 70 000 and below | Ordinary | +100 to +130, +212 to +266 | 300 to 700 | 1 mo. |
| Cold-resistant | CT1D1 | 70 000 and below | Ordinary | -60 to +80, -76 to +176 | 1 000 to 2 000 | 3 to 6 mo. |
| Standard | D1 | 70 000 and below | Very dusty | -10 to +100, +14 to +212 | 100 to 500 | 1 wk. to 1 mo. |
| Standard | D1 | 70 000 and below | Exposed to water splashes | -10 to +100, +14 to +212 | 30 to 100 | 1 day to 1 wk. |

6.3 Grease fitting

NSK bearing units are, as a general rule, provided with a grease fitting, as shown in Table 6.4, and a grease gun is used for regreasing. However, button-head and pin types may also be furnished on demand.

Grease fitting dimensions and the designation of applicable bearing units are given in Table 6.5.

Table 6.4 Grease fitting types available for bearing units.

| Types of housing | Standard grease fitting types |
|------------------|-------------------------------|
| Pillow type | GA type |
| Flange type | GA type |
| Take-up type | GB type |
| Hanger type | GA type |
| Cartridge type | GA type |

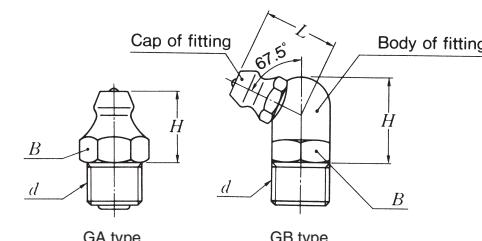

Table 6.5 Grease fitting dimensions and designations of applicable bearing units

GA type(Vertical type)

| Designation | d | H | B |
|---------------|------------|------|-------|
| | mm | inch | mm |
| GA-1/4-28 UNF | 1/4-28 UNF | 8.5 | 0.335 |
| GA-PF 1/8 | G 1/8 | 12 | 0.472 |
| GA-PF 1/4 | G 1/4 | 14 | 0.551 |
| | | | |

GB type(67.5°)

| Designation | d | H | L | B | |
|--------------|------------|------|-------|------|-------|
| | mm | inch | mm | inch | |
| GB-1/4-28UNF | 1/4-28 UNF | 10.5 | 0.413 | 9.3 | 0.366 |
| GB-PF 1/8 | G 1/8 | 14.2 | 0.559 | 13.5 | 0.531 |
| GB-PF 1/4 | G 1/4 | 15 | 0.591 | 13.5 | 0.531 |
| | | | | | |

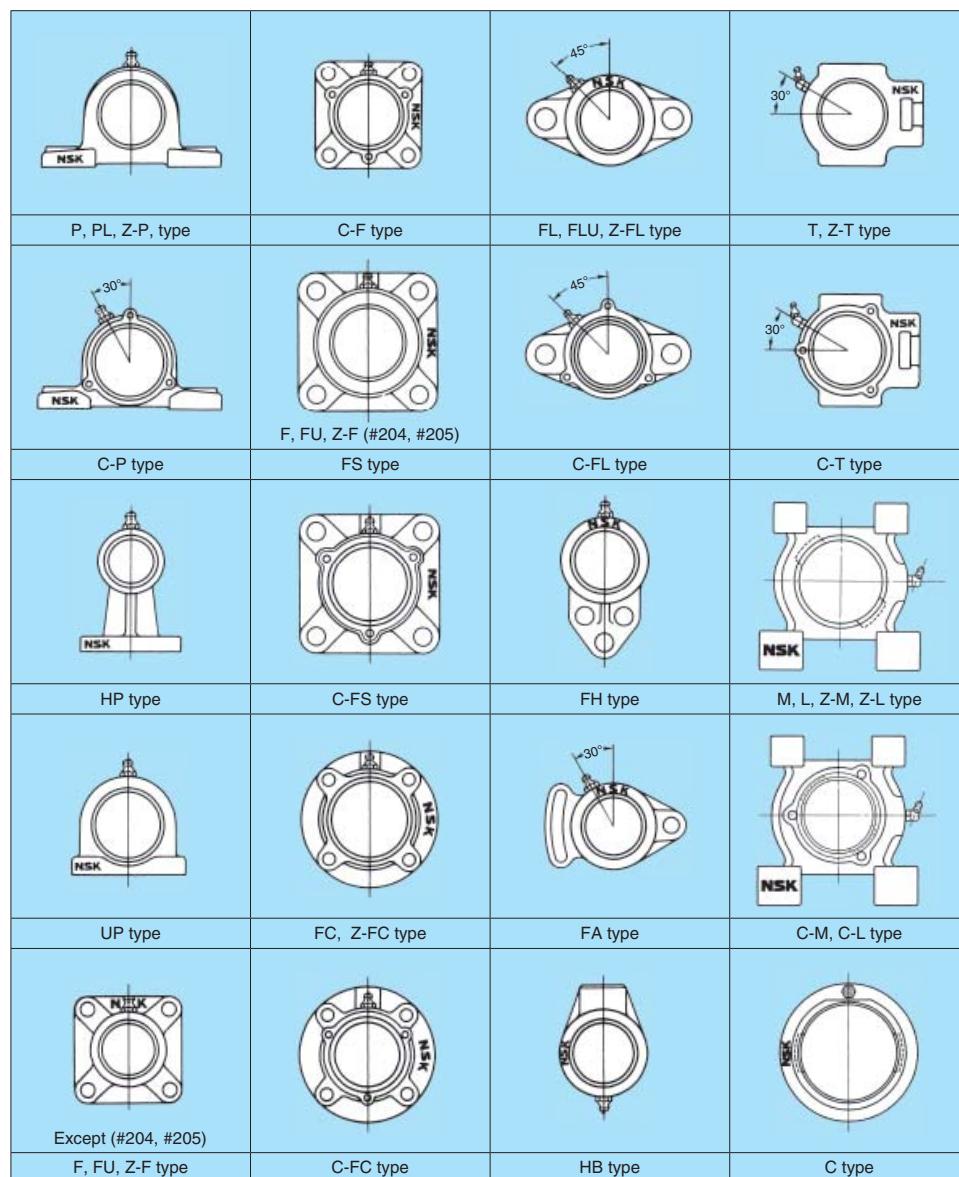

| Nominal screw size d | Series 2 | Series X | Series 3 |
|----------------------|-----------|-----------|-----------|
| 1/4-28 UNF | 203 - 209 | X05 - X08 | 305 - 309 |
| G 1/8 | 210 - 215 | X09 - X14 | 310 - 315 |
| G 1/4 | 216 - 218 | X15 - X20 | 316 - 328 |

Remarks Screw size for the cartridge type is 1/4-28 UNF.

That for C310D1 to C328D1 is G 1/8(PF 1/8).

6.4 standard location of the grease fitting

Standard location of grease fitting on the housing for the relubricatable bearing units of each type is illustrated below.

7. Recommended Torques for Tightening Set Screws

Table 7.1 Recommended torques for tightening set screws

A) Metric series, applied to metric bore size.

| Designation of the bearings of applicable units | Designation of set screws | Tightening torques N·m(max.) |
|---|---------------------------|---|
| UC201 to UC205 | — | M 5x0.8 × 7 3.9 |

Note (*) The permissible load only applies in applications where the load is stable and the speed is 2400 min⁻¹ or less.

The mounting surface should be flat.

Remarks When an anti-vibration rubber ring is used, the self alignment capability will be reduced.

Note (*) The permissible load only applies in applications where the load is stable and the speed is 2400 min⁻¹ or less.

Remarks When an anti-vibration rubber ring is used, the self alignment capability will be reduced.

Notes (¹) If relubricatable type is needed, please order with suffix "D1".

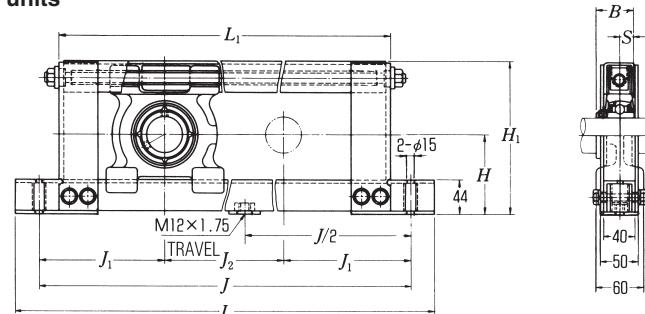

(²) The Stretcher Units is designed to only take a horizontal radial load, in line with the adjustment direction.

Axial loads or vertical radial loads can deform or break the housing.

Note (*) The permissible load only applies in applications where the load is stable and the speed is 2400 min⁻¹ or less.

The mounting surface should be flat.

Remarks When an anti-vibration rubber ring is used, the self alignment capability will be reduced.

Note (*) The Stretcher Units is designed to only take a horizontal radial load, in line with the adjustment direction.
Axial loads or vertical radial loads can deform or break the housing.

⁽¹⁾ These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".⁽²⁾ Adapter number with suffix "X" means a narrow slot type adapter sleeve.

In this case the lock washer with the straight inner prong should be used.

⁽³⁾ For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.

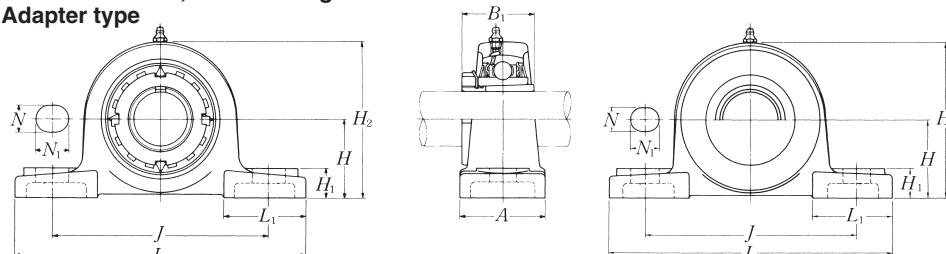

To distinguish it, a suffix "Y" is added.

Remarks Please refer to page A21 for size of grease fitting.

Notes ⁽¹⁾ These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

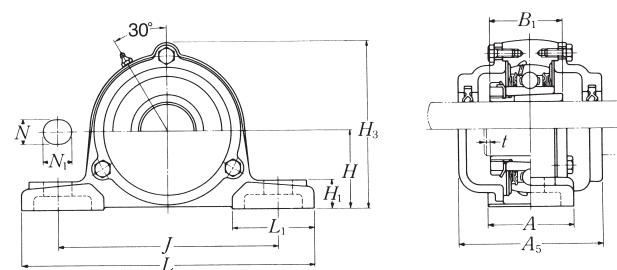

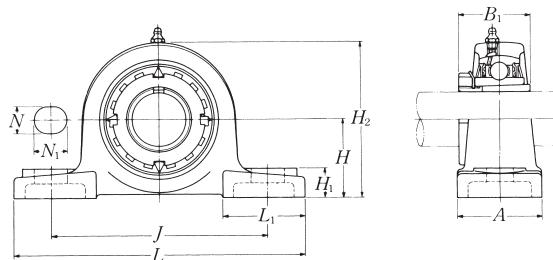

⁽²⁾ Adapter number with suffix "X" means a narrow slot type adapter sleeve.

In this case the lock washer with the straight inner prong should be used.

⁽³⁾ For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.

To distinguish it, a suffix "Y" is added.

Remarks Please refer to page A21 for size of grease fitting.

Notes ⁽¹⁾ These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

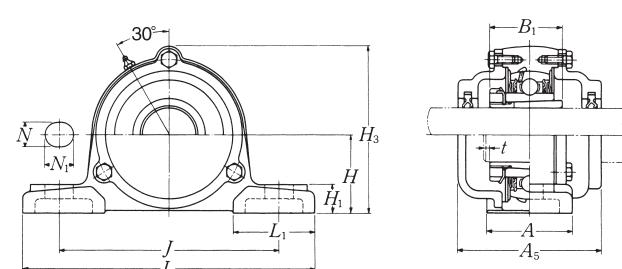

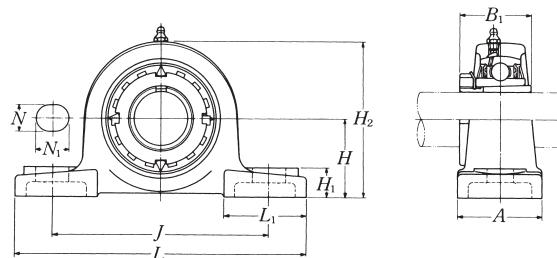

⁽²⁾ Adapter number with suffix "X" means a narrow slot type adapter sleeve.

In this case the lock washer with the straight inner prong should be used.

⁽³⁾ For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.

To distinguish it, a suffix "Y" is added.

Remarks Please refer to page A21 for size of grease fitting.

Notes ⁽¹⁾ These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

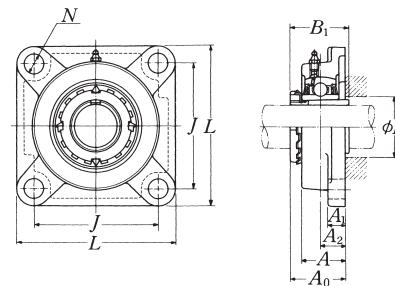

⁽²⁾ Adapter number with suffix "X" means a narrow slot type adapter sleeve.

In this case the lock washer with the straight inner prong should be used.

⁽³⁾ For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.

To distinguish it, a suffix "Y" is added.

⁽⁴⁾ If the inch series housing units with dust cover are ordered with a closed end, the suffixes E, S or A are not included.

Example: ZM-UKF205D1;HE2305

Remarks Please refer to page A21 for size of grease fitting.

Notes ⁽¹⁾ These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

⁽²⁾ Adapter number with suffix "X" means a narrow slot type adapter sleeve.

In this case the lock washer with the straight inner prong should be used.

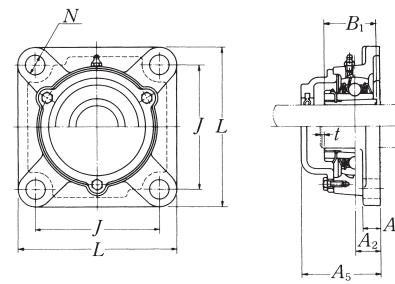

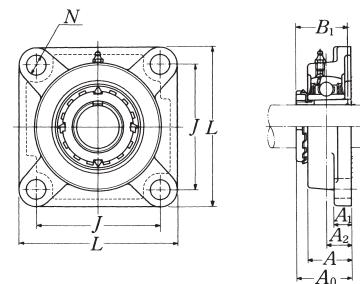

⁽³⁾ If the inch series housing units with dust cover are ordered with a closed end, the suffixes E, S or A are not included.

Example: ZM-UKF205D1;HE2305

Remarks Please refer to page A21 for size of grease fitting.

Notes ⁽¹⁾ These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

⁽²⁾ Adapter number with suffix "X" means a narrow slot type adapter sleeve.

In this case the lock washer with the straight inner prong should be used.

⁽³⁾ For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.

To distinguish it, a suffix "Y" is added.

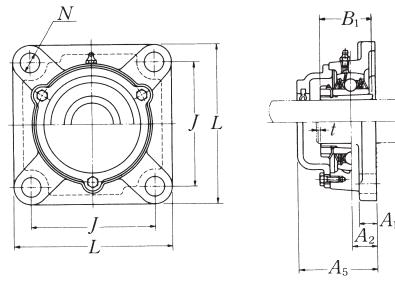

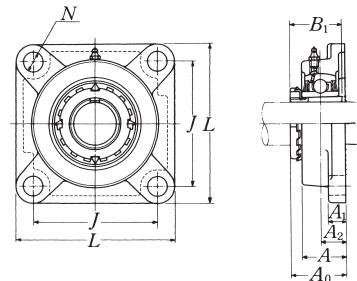

⁽⁴⁾ If the inch series housing units with dust cover are ordered with a closed end, the suffixes E, S or A are not included.

Example: CM-UKF305D1;HE2305

Remarks Please refer to page A21 for size of grease fitting.

Notes ⁽¹⁾ These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

⁽²⁾ Adapter number with suffix "X" means a narrow slot type adapter sleeve.

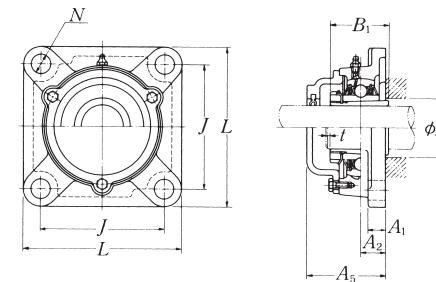

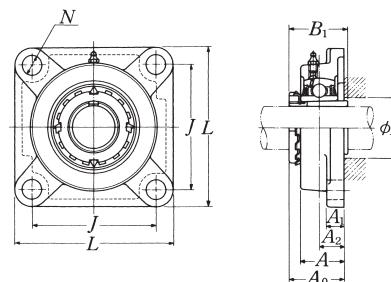

In this case the lock washer with the straight inner prong should be used.

⁽³⁾ For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.

To distinguish it, a suffix "Y" is added.

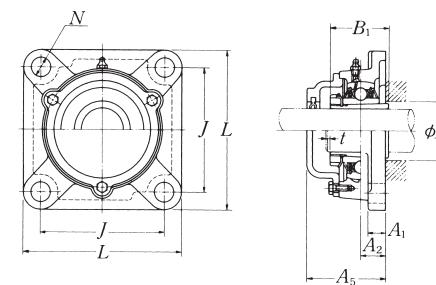

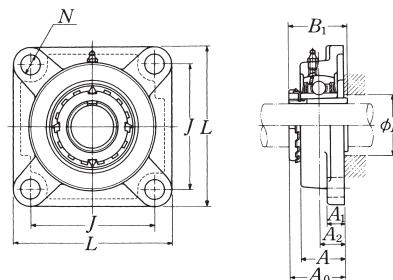

⁽⁴⁾ If the inch series housing units with dust cover are ordered with a closed end, the suffixes E, S or A are not included.

Example: CM-UKFX05D1;HE2305

Remarks Please refer to page A21 for size of grease fitting.

Notes ⁽¹⁾: These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

⁽²⁾: Adapter number with suffix "X" means a narrow slot type adapter sleeve.

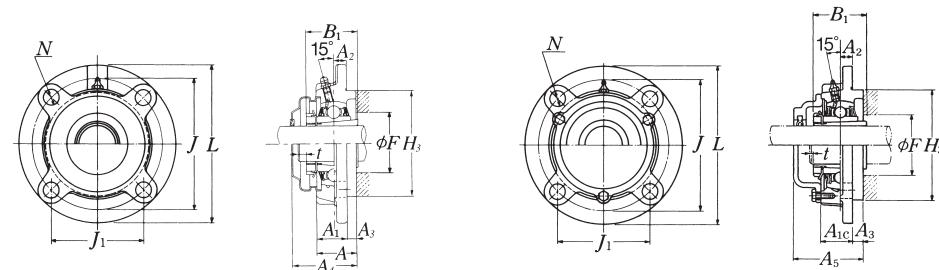

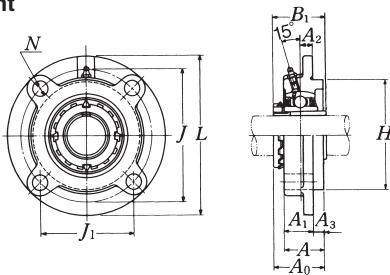

In this case the lock washer with the straight inner prong should be used.

⁽³⁾: If the inch series housing units with dust cover are ordered with a closed end, the suffixes E, S or A are not included.
Example: CM-UKFS305D1;HE2305

Remarks Please refer to page A21 for size of grease fitting.

Notes ⁽¹⁾ These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

⁽²⁾ Adapter number with suffix "X" means a narrow slot type adapter sleeve.

In this case the lock washer with the straight inner prong should be used.

⁽³⁾ For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.

To distinguish it, a suffix "Y" is added.

⁽⁴⁾ If the inch series housing units with dust cover are ordered with a closed end, the suffixes E, S or A are not included.

Example: ZM-UKFC205D1;HE2305

Remarks Please refer to page A21 for size of grease fitting.

Notes ⁽¹⁾ These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

⁽²⁾ Adapter number with suffix "X" means a narrow slot type adapter sleeve.

In this case the lock washer with the straight inner prong should be used.

⁽³⁾ If the inch series housing units with dust cover are ordered with a closed end, the suffixes E, S or A are not included.

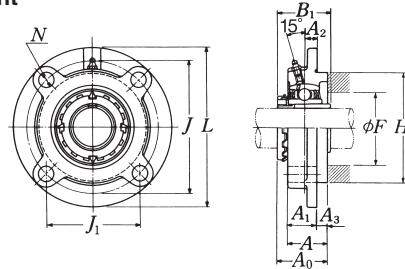

Example: ZM-UKFC205D1;HE2305

Remarks Please refer to page A21 for size of grease fitting.

Notes ⁽¹⁾ These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".⁽²⁾ Adapter number with suffix "X" means a narrow slot type adapter sleeve.

In this case the lock washer with the straight inner prong should be used.

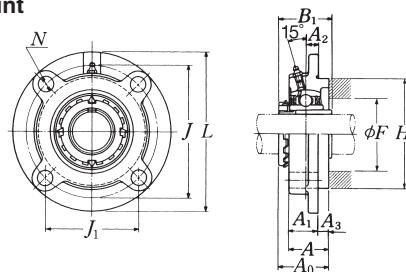

⁽³⁾ For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.

To distinguish it, a suffix "Y" is added.

Remarks Please refer to page A21 for size of grease fitting.

Notes ⁽¹⁾ These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

⁽²⁾ Adapter number with suffix "X" means a narrow slot type adapter sleeve.

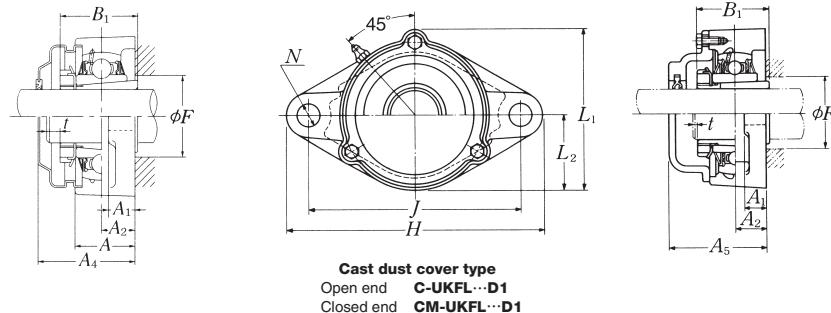

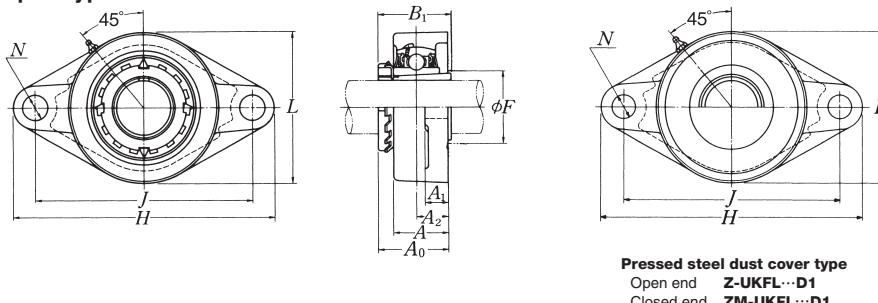

In this case the lock washer with the straight inner prong should be used.

Remarks Please refer to page A21 for size of grease fitting.

Notes ⁽¹⁾ These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".⁽²⁾ Adapter number with suffix "X" means a narrow slot type adapter sleeve.

In this case the lock washer with the straight inner prong should be used.

⁽³⁾ For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.

To distinguish it, a suffix "Y" is added.

⁽⁴⁾ If the inch series housing units with dust cover are ordered with a closed end, the suffixes E, S or A are not included.

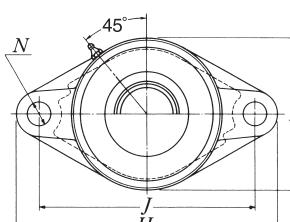

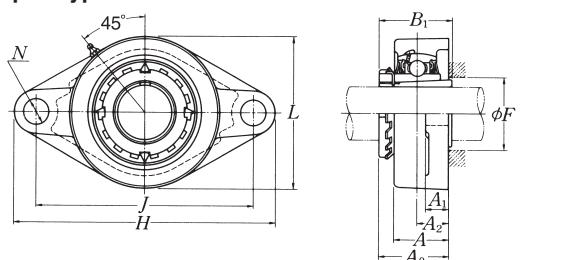

Example: ZM-UKFL205D1;HE2305

Remarks Please refer to page A21 for size of grease fitting.

Notes ⁽¹⁾ These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

⁽²⁾ Adapter number with suffix "X" means a narrow slot type adapter sleeve.

In this case the lock washer with the straight inner prong should be used.

⁽³⁾ For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.

To distinguish it, a suffix "Y" is added.

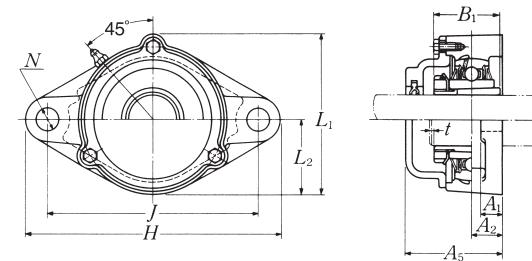

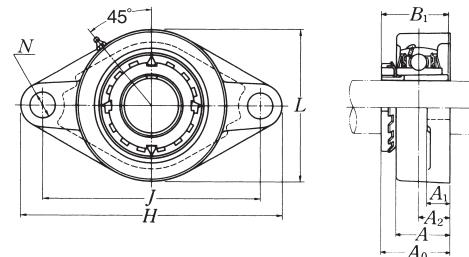

⁽⁴⁾ If the inch series housing units with dust cover are ordered with a closed end, the suffixes E, S or A are not included.

Example: CM-UKFL305D1;HE2305

Remarks Please refer to page A21 for size of grease fitting.

Notes ⁽¹⁾ These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

⁽²⁾ Adapter number with suffix "X" means a narrow slot type adapter sleeve.

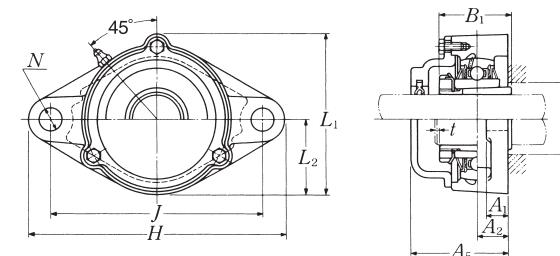

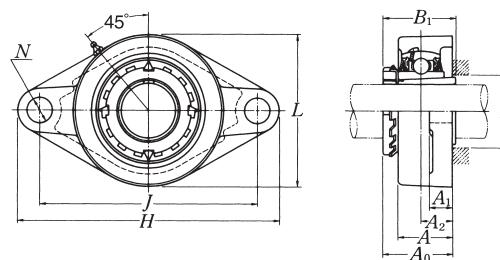

In this case the lock washer with the straight inner prong should be used.

⁽³⁾ If the inch series housing units with dust cover are ordered with a closed end, the suffixes E, S or A are not included.

Example: CM-UKFLX05D1;HE2305

Remarks Please refer to page A21 for size of grease fitting.

Notes ⁽¹⁾ These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

⁽²⁾ Adapter number with suffix "X" means a narrow slot type adapter sleeve.

In this case the lock washer with the straight inner prong should be used.

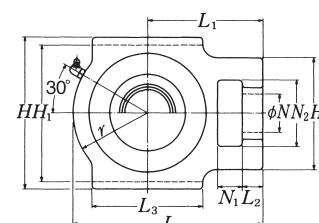

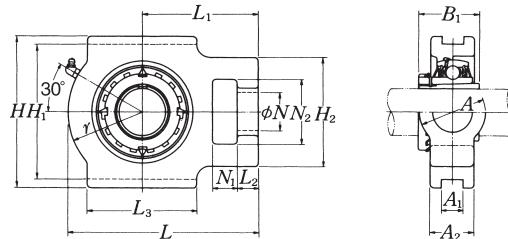

⁽³⁾ For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.

To distinguish it, a suffix "Y" is added.

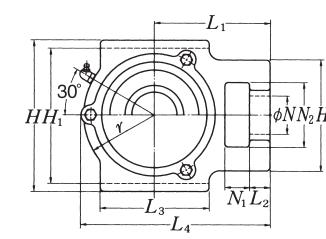

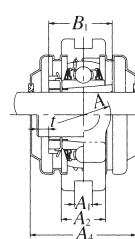

Remarks Please refer to page A21 for size of grease fitting.

Notes ⁽¹⁾ These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

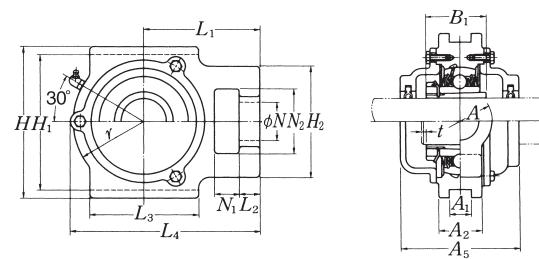

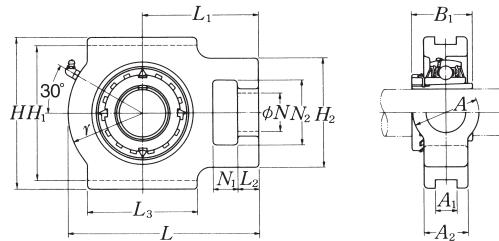

⁽²⁾ Adapter number with suffix "X" means a narrow slot type adapter sleeve.

In this case the lock washer with the straight inner prong should be used.

⁽³⁾ For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.

To distinguish it, a suffix "Y" is added.

Remarks Please refer to page A21 for size of grease fitting.

Notes ⁽¹⁾ These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

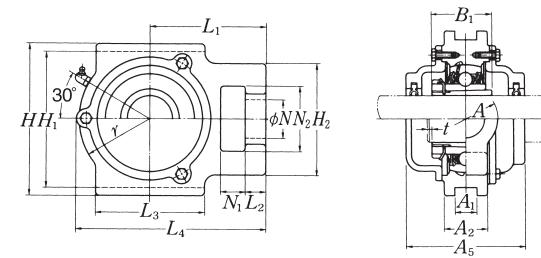

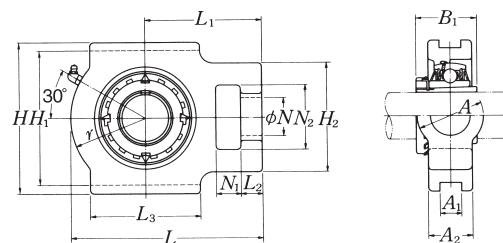

⁽²⁾ Adapter number with suffix "X" means a narrow slot type adapter sleeve.

In this case the lock washer with the straight inner prong should be used.

⁽³⁾ For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.

To distinguish it, a suffix "Y" is added.

Remarks Please refer to page A21 for size of grease fitting.

⁽²⁾ Adapter number with suffix "X" means a narrow slot type adapter sleeve.
In this case the lock washer with the straight inner prong should be used.

⁽³⁾ For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.
To distinguish it, a suffix "Y" is added.

Remarks Please refer to page A21 for size of grease fitting.

Notes (¹) These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

(²) Adapter number with suffix "X" means a narrow slot type adapter sleeve.

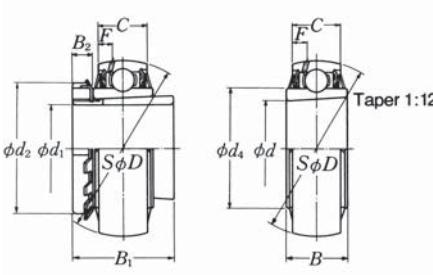

In this case the lock washer with the straight inner prong should be used.

(³) For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.

To distinguish it, a suffix "Y" is added.

Notes (¹) These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

(²) Adapter number with suffix "X" means a narrow slot type adapter sleeve.
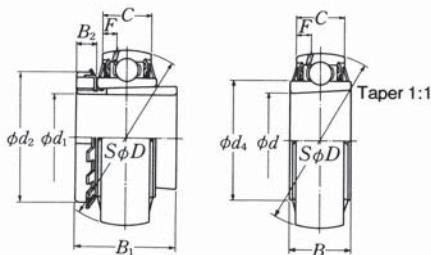

In this case the lock washer with the straight inner prong should be used.

Notes (¹) These numbers indicate relubricatable type. If maintenance free type is needed, please order without suffix "D1".

(²) Adapter number with suffix "X" means a narrow slot type adapter sleeve.

In this case the lock washer with the straight inner prong should be used.

(³) For HE2311XY, screw thread pitch different from the standard is applied, because of the thin thread section of sleeve.

To distinguish it, a suffix "Y" is added.
