**The right product  
for every application**

**Optimum benefit  
for you**

With its forward-looking bearing arrangement solutions for feed spindles, main spindles, rotary tables and linear guidance units, Schaeffler KG has been at the forefront of the world market for decades. The bearing components alone, however, are often no longer the decisive factor for these machine subsystems.

Our customers have of course benefited directly from significant performance improvements and unique selling propositions thanks to our “ready-to-fit” products; these compact, ready-to-fit bearings are used in accordance with the simple principle: unpack, screw mount, use. In order to optimise the entire machine tool system, however, it is becoming ever more important not simply to support the subsystems but to integrate important functions such as measurement, sealing, lubrication, braking etc. in the components themselves. This intellectual approach is fulfilled comprehensively by the new concept **added competence** in the Production Machinery Sector since it attaches central importance to systems solution thinking for the bearing, bearing position and entire system. This means that you can now access a product range that gives optimum coverage for all your applications in the machine tool.

Since direct drives and mechatronic solutions are used ever more frequently in machine tools, we have incorporated a further strong partner in the form of IDAM – INA Drives & Mechatronics – in our spectrum of capabilities. In this way, we can now supply you from a single source with bearing elements and the appropriate drive system to give complete systems that are precisely matched to each other. This opens up completely new technical and economic design possibilities for your requirements as well as significant advantages in the time and process chain.

In terms of products, we offer you a comprehensive, precisely balanced range, precision technology and top product quality. In order to match the pulse of your developments as closely as possible, furthermore, we have a worldwide network of engineers, service and sales technicians working for you and ensuring that we maintain close contact with you in your own location.

In conclusion, we are convinced that we will always have the right product for your application. Just contact us to see what we can do for you.

# Bearings for screw drives

## Matrix for preselection of bearings

4

The application-oriented matrix allows rapid preselection of the suitable bearing.

## Axial angular contact ball bearings

6

Axial angular contact ball bearings are precision bearings for screw drives. Depending on the series, they can support radial forces as well as axial forces from one or both sides. The inner ring is matched to the ball and cage assemblies and the outer ring. As a result, the bearings can be set to a defined axial preload. Contact seals protect the rolling element system against contamination and moisture. For higher speeds, gap seals can be used.

The bearings are available with and without fixing holes in the outer ring. Bearings with holes are screw mounted directly on the adjacent construction. This solution is particularly economical since there is no need for the locating bore otherwise required or for the bearing cover with the associated matching work.

For many applications, a bearing arrangement of lower precision is often sufficient. For this purpose, bearings with less stringent tolerances are available.

## Needle roller/axial cylindrical roller bearings

60

These bearings are double direction precision axial cylindrical roller bearings with a radial bearing component. The inner ring, outer ring and cylindrical roller and cage assemblies are matched to each other such that they can be set to a defined axial preload using a precision locknut.

The bearings are available with and without fixing holes in the outer ring. Bearings with holes are screw mounted directly on the adjacent construction. The large contact surface and the small pitch of the holes allows a connection to the adjacent construction that is extremely rigid and with low tendency to settling. The bearing cover that would otherwise be required to hold the bearing, and the matching work required, can therefore be dispensed with.

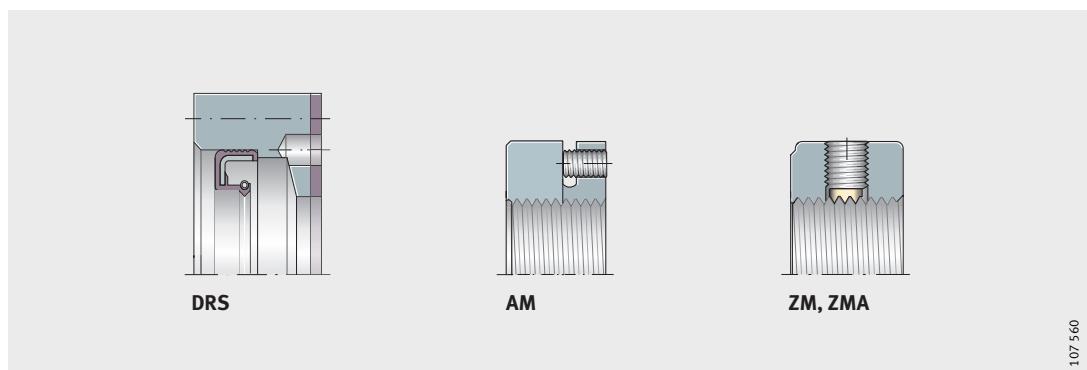

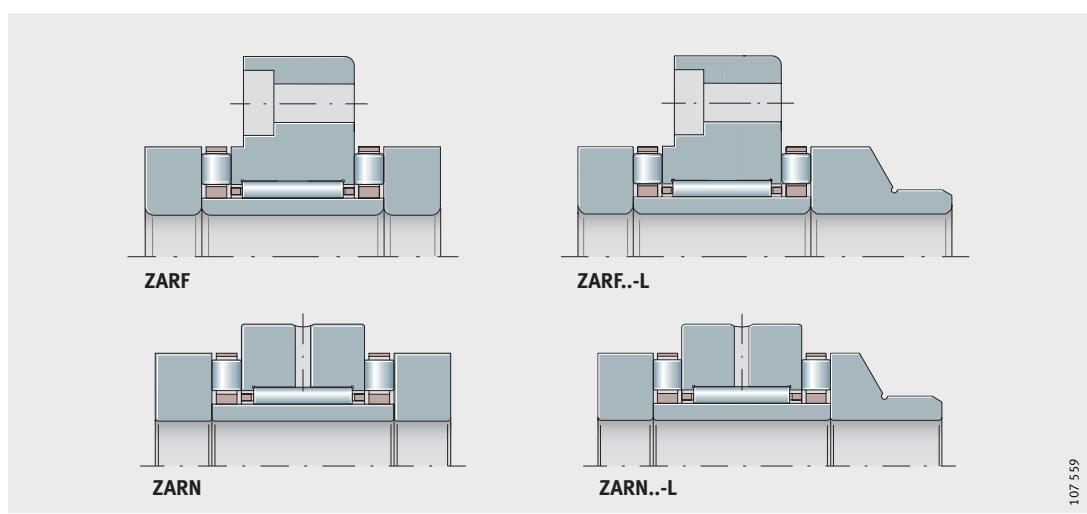

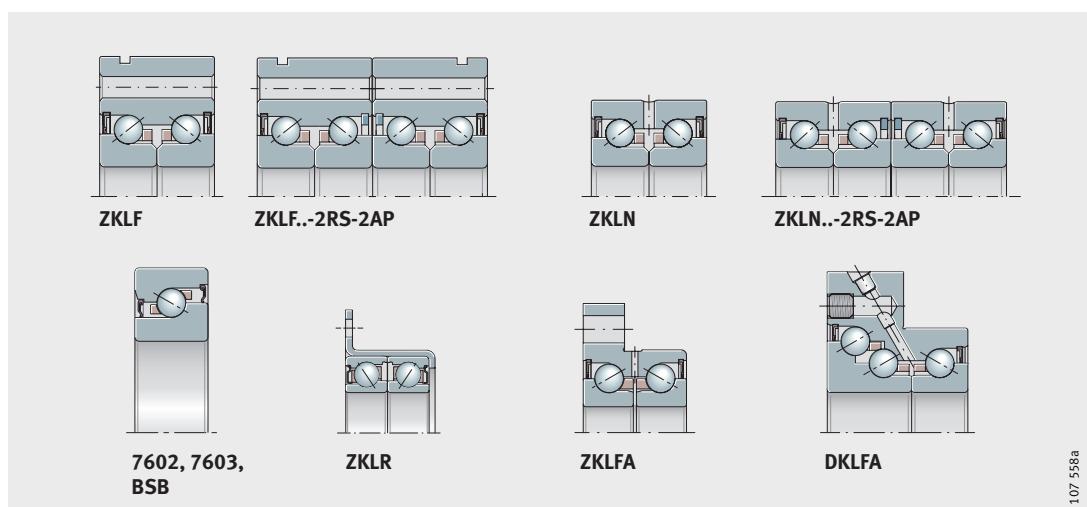

If the axial abutment of the shaft locating washer is not sufficient or a seal raceway is required, bearings with a stepped, extended shaft locating washer on one side are suitable.

## Seal carrier assemblies Precision locknuts

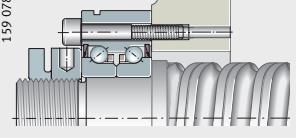

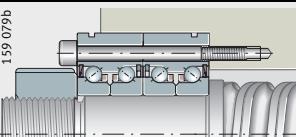

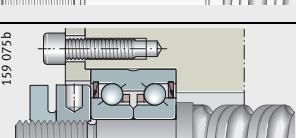

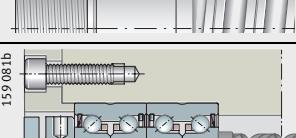

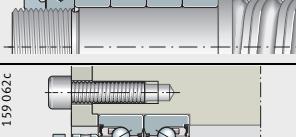

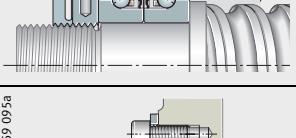

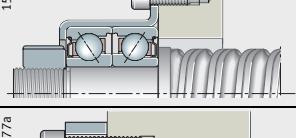

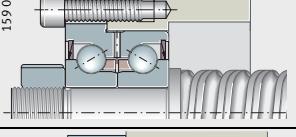

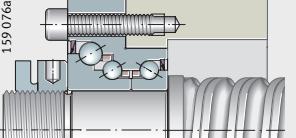

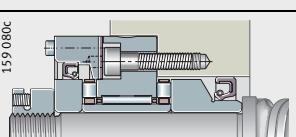

88

Seal carrier assemblies DRS are complete sealing sets that are screw mounted on the outer ring of needle roller/axial cylindrical roller bearings ZARF(L). They are precisely centred in this position and seal the bearings against external influences.

The precision locknuts AM, ZM, ZMA for axial or radial locking are used to set bearings for screw drives to a defined axial preload. They are also used where high axial forces must be supported and high runout accuracy and rigidity are required.

# Axial angular contact ball bearings

Features	Screw drive bearing arrangements are subjected to requirements that often cannot be optimally fulfilled by the design construction of conventional bearings. For the design of bearing arrangements for the highly dynamic operating conditions in screw drives that have high accuracy, high load carrying capacity, high rigidity, low friction, are easy to fit and maintenance-free or low-maintenance, there is a wide range of INA and FAG axial angular contact ball bearings. With this product range, solutions can be found to all the technical and economic demands placed on the bearing arrangements of screw drives.
Single row and multi-row designs	Axial angular contact ball bearings are available as single, double or triple row ready-to-fit units. They are self-retaining and comprise thick-walled, geometrically stable outer rings, ball and cage assemblies and one-piece or two-piece inner rings. In several series, the outer ring has through holes for simple flange mounting to the adjacent construction. The bearing rings are matched to each other such that a defined preload is achieved when the rings are clamped in place using a precision locknut.
Radial and axial load carrying capacity	Due to the contact angle of 60°, the bearings can support not only radial forces but high axial forces as well.
Double row, for screw mounting	Axial angular contact ball bearings ZKLF are screw mounted directly on the adjacent construction or in a radial locating bore, <i>Figure 1</i> and <i>Figure 2</i> , page 11. The cover that would otherwise be required and the associated matching work can therefore be dispensed with. In order to aid removal of the bearings from a locating bore, the outer ring has a circumferential extraction slot. Relubrication is facilitated by radial and axial threaded connectors with detachable grub screws.

ZKLF..-2RS  
ZKLF..-2Z

*Figure 1*  
Outer ring screw mounted  
on flat adjacent construction,  
preloaded using locknut

159 078

### With less stringent tolerances

Axial angular contact ball bearings ZKLF..-2RS-PE correspond to series ZKLF but have a runout tolerance within P5 to DIN 620, less stringent diameter tolerances and the suffix PE. They are used where a lower positional accuracy is acceptable. As a result, the adjacent construction does not need to be as accurate with these bearings.

Relubrication is facilitated by an axial threaded connector. The radial lubrication duct is firmly closed off.

ZKLF..-2RS-PE

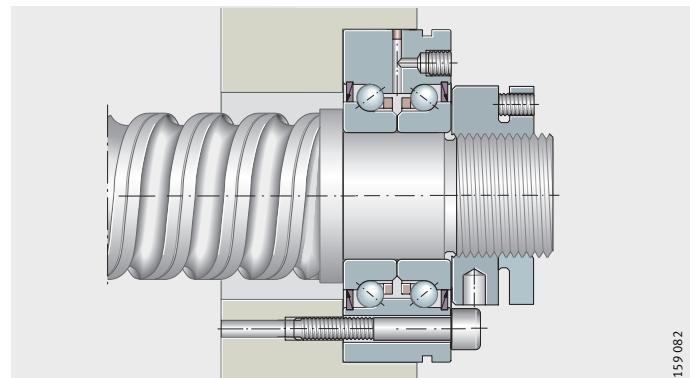

Figure 2

Outer ring screw mounted in bore,  
preloaded using locknut

### Heavy series

Axial angular contact ball bearings ZKLF..-2RS and ZKLF..-2Z are also available in a heavy series. For the same shaft diameter, they have a larger cross-section and thus higher basic load ratings.

### Matched pairs

Bearings of series ZKLF..-2RS-2AP comprise a matched pair of bearings ZKLF..-2RS, *Figure 3*. The individual bearings are matched to each other.

Matched bearings have an arrow marking on the outside surface of the outer rings. When the bearings are arranged correctly, the lip seals face outwards. During fitting, the hole pattern of the two bearings must match, not the marking.

# Axial angular contact ball bearings

<b>Seals</b>	Bearings with the suffix 2RS have lip seals and highly effective sealing. Bearings with the suffix 2Z are sealed using gap seals and are suitable for higher speeds.
<b>Lubrication</b>	The bearings are greased using a lithium soap grease to GA28 and can be lubricated via the lubrication connectors in the outer ring. For the majority of applications, the initial greasing is sufficient for the whole bearing operating life.
<b>Double row, not for screw mounting</b>	Axial angular contact ball bearings ZKLN are mounted in a housing bore, <i>Figure 4</i> . The bearing outer ring is axially located by a cover.
<b>ZKLN..-2RS ZKLN..-2Z</b>	 <p><i>Figure 4</i> Outer ring located using cover, preloaded using locknut</p> <p>159 075</p>
<b>With less stringent tolerances</b>	Axial angular contact ball bearings ZKLN..-2RS-PE correspond to series ZKLN but have a runout tolerance within P5 to DIN 620, less stringent diameter tolerances and the suffix PE. They are used where a lower positional accuracy is acceptable. As a result, the adjacent construction does not need to be as accurate with these bearings.
<b>Heavy series</b>	Axial angular contact ball bearings ZKLN..-2RS and ZKLN..-2Z are also available in a heavy series. For the same shaft diameter, they have a larger cross-section and thus higher basic load ratings.

### **Matched pairs**

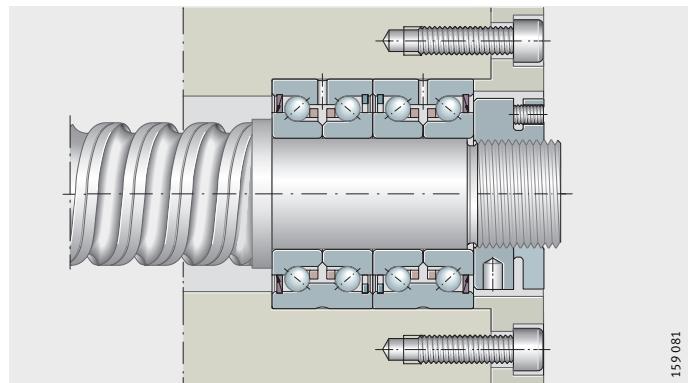

Bearings of series ZKLN..-2RS-2AP comprise a matched pair of bearings ZKLN..-2RS, *Figure 5*. The individual bearings are matched to each other.

Matched bearings have an arrow marking on the outside surface of the outer rings. When the bearings are arranged correctly, the lip seals face outwards.

The bearing outer rings are axially clamped by a cover, *Figure 5*.

**ZKLN..-2RS-2AP**

*Figure 5*  
Matched pair,  
outer rings located using cover,  
preloaded using locknut

### **Lubrication**

The bearings are greased using a lithium soap grease to GA28 and can be lubricated via a lubrication slot and lubrication holes in the outer ring. For the majority of applications, the initial greasing is sufficient for the whole bearing operating life.

### **Seals**

Bearings with the suffix 2RS have lip seals and highly effective sealing.

Bearings with the suffix 2Z are sealed using gap seals and are suitable for higher speeds.

**7602..-2RS, 7603..-2RS, BSB..-2RS**

*Figure 6*  
Single row axial angular  
contact ball bearings,  
two-bearing set in O arrangement

Bearings 7602, 7603 and BSB are designed as universal bearings, *Figure 6* and *Figure 7*.

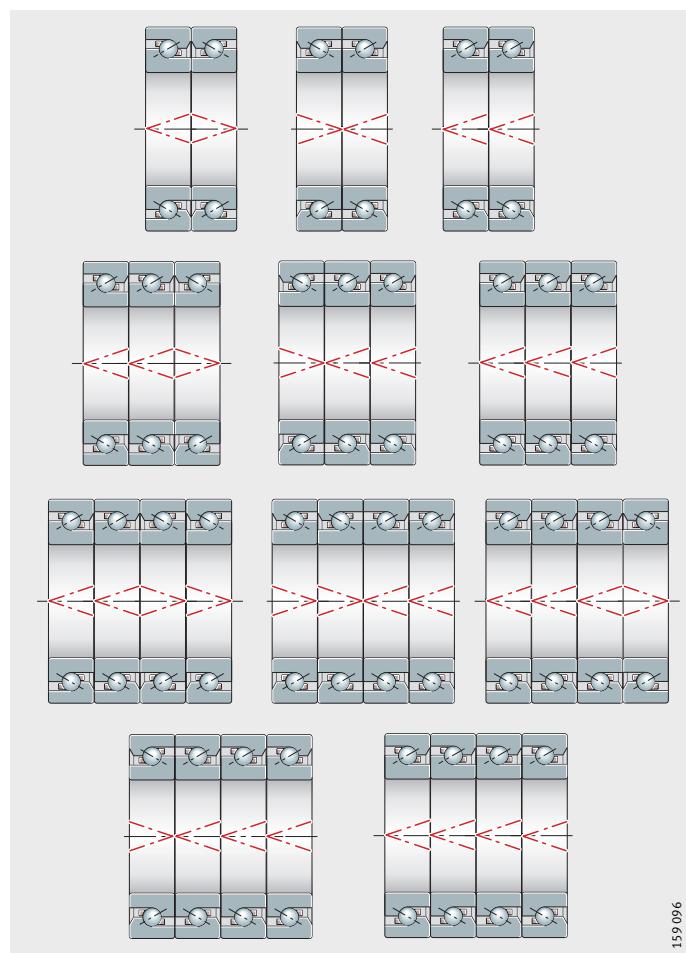

They can be combined in a wide range of sets for different requirements, *Figure 7*.

159 062b

**7602, 7603, BSB**

*Figure 7*  
Set combinations

159 096

<b>Seals</b>	Single row axial angular contact ball bearings for matching are bearings of the open basic design. However, some sizes are fitted with seals.
<b>Lubrication</b>	Single row axial angular contact ball bearings of the open basic design are not supplied greased. The designs fitted with seals are greased for life with Arcanol L55.
<b>Angular contact ball bearing unit, for screw mounting</b>	<p>Angular contact ball bearing units ZKLR are low-cost bearings and therefore particularly economical. They comprise a deep drawn sheet steel housing with an integral matched pair of angular contact ball bearings in an X arrangement, <i>Figure 8</i>. The housing has a Corrotect® coating and is thus protected against rust. The ball bearings are sealed on both sides by lip seals or gap seals. The bearing assembly is preloaded clearance-free.</p>

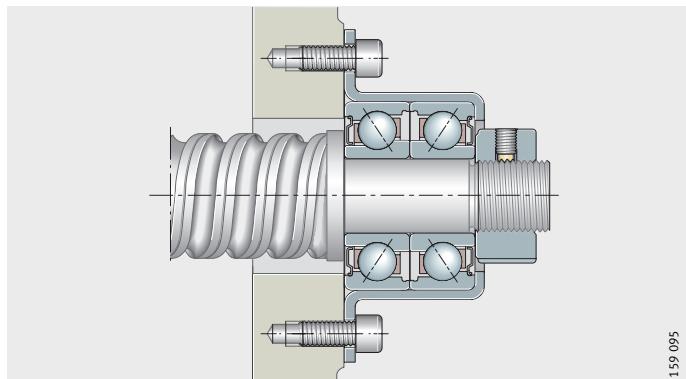

**ZKLR..-2RS  
ZKLR..-2Z**

*Figure 8*  
Angular contact ball bearing unit

#### Particularly easy to fit

The units are particularly easy to fit.  
They:

- are directly flange mounted, for example on the milled face of the adjacent construction. This eliminates the need for precise, costly fits and additional flange covers for seating and axial location of the bearings
- require no additional parts for location of the bearings in the housing
- reduce errors in fitting due to the smaller number of components compared to conventional solutions
- are self-aligning by means of the screw drive nut during fitting. This effectively eliminates any warping due to misalignment of the bearing seats
- have a defined preload. It is not necessary to preload the bearing during fitting as is usually the case with screw drive bearing arrangements
- require only clearance-free axial location on the threaded spindle.

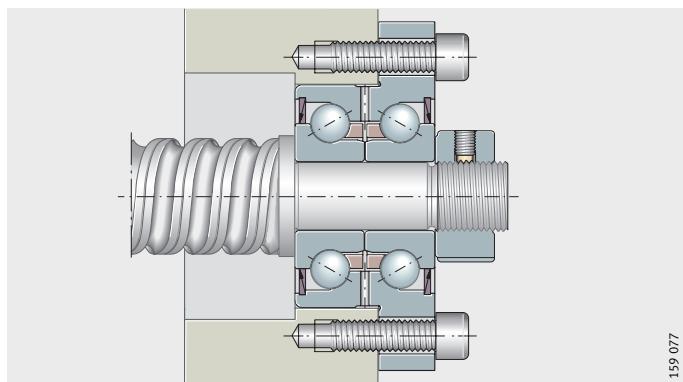

159 095

# Axial angular contact ball bearings

<b>Seals</b>	Bearings with the suffix 2RS have lip seals and highly effective sealing. Bearings with the suffix 2Z are sealed using gap seals and are suitable for higher speeds.
<b>Lubrication</b>	The bearings are greased using a lithium soap grease to DIN 51825-K2N-40.
<b>Operating limits</b>	The units are highly suitable, due to their dimensions and design, for space-saving and simple bearing arrangements in highly dynamic screw drives, for example: <ul style="list-style-type: none"><li>■ in inspection and measuring equipment</li><li>■ in small machine tools</li><li>■ in medical and laboratory equipment</li><li>■ in precision engineering and electronic components manufacture</li><li>■ where complete units will give a simpler bearing arrangement.</li></ul>
<b>Double row, with flange, for screw mounting</b>	Series ZKLFA has a stepped outer ring. It can therefore be screw mounted easily on the adjacent construction, <i>Figure 9</i> . The flange has flattened areas on both sides, so the radial design envelope in the adjacent construction can be kept very small.

ZKLFA..-2RS  
ZKLFA..-2Z

*Figure 9*  
Outer ring screw mounted  
on adjacent construction,  
preloaded using locknut

<b>Seals</b>	Bearings with the suffix 2RS have lip seals and highly effective sealing. Bearings with the suffix 2Z are sealed using gap seals and are suitable for higher speeds.
<b>Lubrication</b>	The bearings are greased using a lithium soap grease to GA28 and can be lubricated via a lubrication groove and lubrication holes in the outer ring. For the majority of applications, the initial greasing is sufficient for the whole bearing operating life.

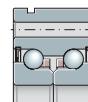

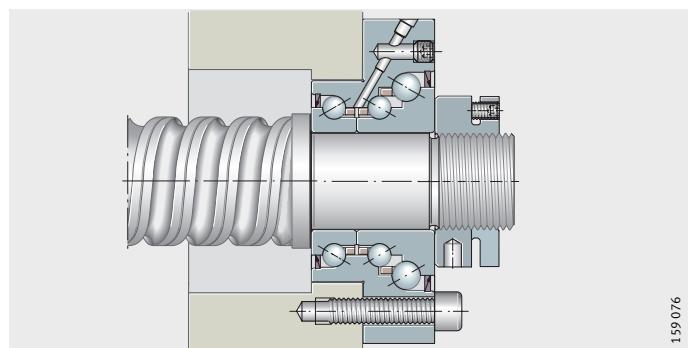

## **Triple row, with flange, for screw mounting**

Axial angular contact ball bearings DKLFA..-2RS have, in addition to two rows of balls with a contact angle of 60° in an O arrangement, an extra row of balls, *Figure 10*. Due to this additional row, the bearings can support higher axial loads in one direction.

Due to the stepped outer ring, the bearings can be easily flange mounted on the adjacent construction. The flange has flattened areas on both sides. As a result, it requires only a small design envelope in the adjacent construction.

**DKLFA..-2RS**

*Figure 10*  
Outer ring screw mounted  
on adjacent construction,  
preloaded using locknut

In order to make full use of the load carrying capacity of bearings DKLFA..-2RS, their design requires that they are subjected to continuous load in the main load direction. They are therefore used mainly in screw drives with a locating/locating bearing arrangement and tensioned spindles or in vertically arranged screw drive bearing arrangements.

For design of the bearing arrangement, please contact us.

### **Seals**

Triple row axial angular contact ball bearings have lip seals on both sides.

### **Lubrication**

The bearings are greased using a lithium soap grease to GA28. If necessary, lubrication can be carried out via a threaded connector for central lubrication systems on the flange side.

For calculation of relubrication intervals based on a stated load spectrum (speed, load, operating duration, environmental conditions), please contact us.

# Axial angular contact ball bearings

## Operating temperature

Sealed axial angular contact ball bearings are suitable for operating temperatures from  $-30^{\circ}\text{C}$  to  $+120^{\circ}\text{C}$ , restricted by the grease, the seal material and the plastic cages in the ball and cage assemblies.

The operating temperature influences the dynamic bearing characteristics. The values given in the dimension table are based on a room temperature of  $+20^{\circ}\text{C}$ .

## Cages

The axial angular contact ball bearings have plastic cages. The cage design is not indicated in the suffix.

In series 7602, 7603 and BSB, the polyamide cages are indicated by the suffix TVP or T.

## Suffixes

Suffixes for the available designs: see table.

## Available designs

Suffix	Description	Design
PE	Less stringent bearing design	Standard
T, TVP	Polyamide cage, guided by balls	
2AP	Axial angular contact ball bearings, matched pair (ZKLN, ZKLF)	
2RS	Contact seals on both sides	
2Z	Gap seals on both sides	

## Design and safety guidelines

### Basic rating life

The decisive factors in determining the bearing size are the basic rating life, the static load safety factor and the axial limiting load. The basic rating life  $L$  and  $L_h$  are calculated as follows:

$$L_{10} = \left( \frac{C}{P} \right)^p$$

$$L_{10h} = \frac{16\,666}{n} \cdot \left( \frac{C}{P} \right)^p$$

$L_{10}$   $10^6$  revolutions  
Basic rating life in millions of revolutions

$L_{10h}$  h  
Basic rating life in operating hours

$C_r, C_a$  N  
Basic dynamic radial or axial load rating according to dimension table

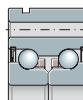

$C_r$  is valid for a contact angle  $\alpha \leq 45^\circ$ ,

$C_a$  is valid for a contact angle  $\alpha > 45^\circ$

P N  
Equivalent dynamic bearing load

p –  
Life exponent  $p = 3$

n  $\text{min}^{-1}$   
Operating speed.

### Resultant and equivalent bearing load P for ZKLR

Bearing unit Designation	Factor P
ZKLR0624-2Z	$P = 140 + 0,13 F_a^{1,4} + 0,003 \cdot F_r^{1,9}$
ZKLR0828-2Z	$P = 210 + 0,28 F_a^{1,27} + 0,002 \cdot F_r^{1,9}$
ZKLR1035-2Z	$P = 240 + 0,47 F_a^{1,17} + 0,0015 \cdot F_r^{1,9}$
ZKLR1244-2RS	$P = 580 + 0,046 F_a^{1,3} + 0,076 \cdot F_r^{1,28}$
ZKLR1547-2RS	$P = 540 + 0,011 F_a^{1,5} + 0,022 \cdot F_r^{1,45}$
ZKLR2060-2RS	$P = 960 + 0,0082 F_a^{1,5} + 0,017 \cdot F_r^{1,45}$

### Static limiting load diagrams for ZKLR

The easy-to-use static limiting load diagrams allow quick verification of the bearing size of series ZKLR, as a function of the axial and radial operating load, *Figure 21* to *Figure 23*, page 25.

The decisive requirement is that the intersection between the axial and radial load must be below the limit line.

Example: If the operating loads  $F_a$  and  $F_r$  are below the limit line, the bearing size is suitable for the application, see example *Figure 23*, page 25.

# Axial angular contact ball bearings

**Resultant and equivalent bearing load P for ZKLN, ZKLF, ZKLFA, DKLFA, BSB, 7602, 7603**

The bearings are axially preloaded to a defined value if the recommended precision locknuts are used and the correct nut tightening torque is applied. The resultant axial bearing load  $F_{a\ res}$  is determined from the axial operating load  $F_{aB}$  and taking account of the axial preload according to *Figure 11*, page 21, to *Figure 15*, page 22. For 7602, 7603 and BSB, the  $F_{a\ res}$  diagrams are based on two-bearing sets in an O or X arrangement, see page 14.

For calculation of other set combinations, please contact us.

A load in excess of the limit value will lead to the rolling element row without load lifting off the raceway. As a result, higher wear will occur under rapid acceleration. For extreme moment loads and statically overdefined systems (locating/locating bearing arrangements), please contact us. The calculation program BEARINX® can give a precise design in this case.

**Axial and radial operating loads**

Under purely axial load,  $P = F_{a\ res}$ . If additional radial operating loads are present,  $P$  must be calculated as follows:

$$P = X \cdot F_r + Y \cdot F_{a\ res}$$

The values X and Y are given in the following table.

**Factors X and Y**

Load ratio	Factor	
	X	Y
$\frac{F_{a\ res}}{F_r} \leq 2,17$	1,9	0,55
$\frac{F_{a\ res}}{F_r} > 2,17$	0,92	1

**Load varying in steps**

In this case,  $P$  and  $n$  are calculated as follows ( $q$  = time portion %):

$$P = p \sqrt{\frac{q_1 \cdot n_1 \cdot P_1^p + \dots + q_z \cdot n_z \cdot P_z^p}{q_1 \cdot n_1 + \dots + q_z \cdot n_z}}$$

$$n = \frac{q_1 \cdot n_1 + \dots + q_z \cdot n_z}{100}$$

**Static load safety factor**

The static load safety factor  $S_0$  indicates the security against impermissible permanent deformations in the bearing:

$$S_0 = \frac{C_0}{P_0}$$

$S_0$  –

Static load safety factor

$C_0$ ,  $C_{0a}$  N

Basic static radial or axial load rating according to dimension table

$C_0$  is valid for a contact angle  $\alpha \leq 45^\circ$ ,

$C_{0a}$  is valid for a contact angle  $\alpha > 45^\circ$

$P_0$  N

Maximum static load of bearing.

In machine tools,  $S_0$  should be  $\geq 4$ .

## Resultant bearing load $F_{a\ res}$

### Example (red lines)

Bearing ZKLN1545

Axial operating load  $F_{aB} = 1500 \text{ N}$

$F_{a\ res} \approx 1750 \text{ N}$

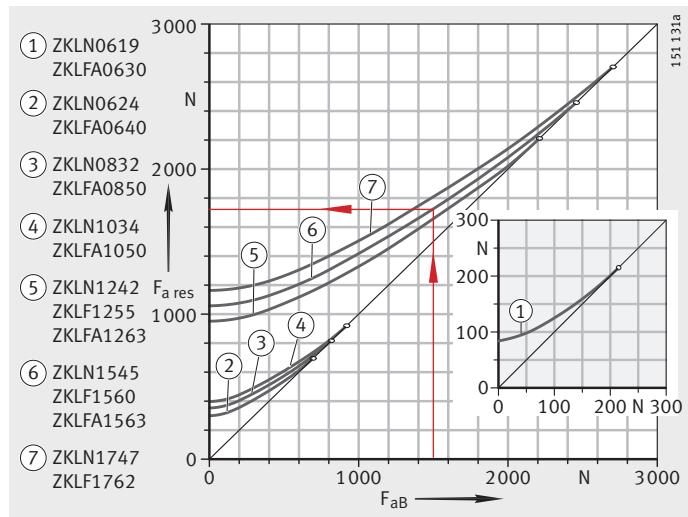

Loading by operating load and preload

$F_{aB}$  = operating load

$F_{a\ res}$  = resultant bearing load

## Maximum radial load on screw connections for ZKLF

If bearings of series ZKLF are screw mounted on a flat adjacent construction, the maximum radial load that can be supported by the screw connections must be taken into consideration.

If the screws used are as stated in the dimension tables to DIN EN ISO 4 762, the maximum radial load that can be supported before the outer ring moves, in the case of dry components, is restricted to  $\approx 0,1 \times C_{0a}$ . If the outer ring is additionally bonded in place using, for example, Loctite 638, the maximum radial load that can be supported increases to approx.  $\approx 0,5 \times C_{0a}$ .

If the maximum radial loads that can be supported (without any axial load content) are considered in relation to the rolling element set, it can be seen that:

- With a static load safety factor of  $S_0 \geq 4$  as required for machine tools, the load that can be supported by the screw connections of the outer ring is in any case greater than the radial load as restricted by the rolling element set.

This means that (at least in theory) radial loads can be supported that, in relation to the rolling element set, will lead to a static load safety factor of  $S_0 \leq 1$  (incipient plastic deformation of rolling elements), if the outer ring is additionally bonded in place.

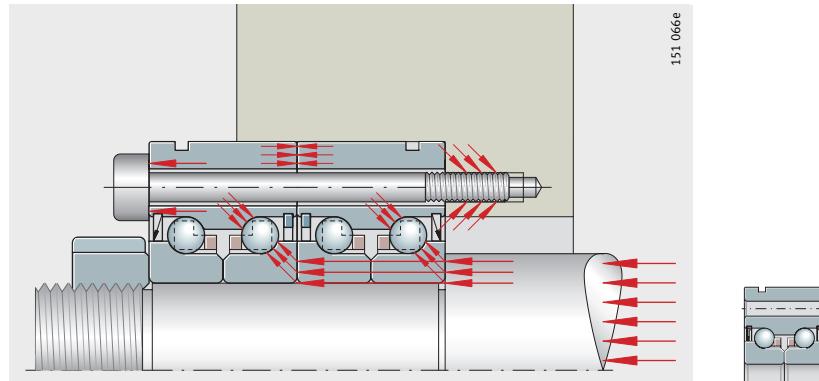

This means that, under normal design criteria and with the decisive static load safety factor for the corresponding areas of application (e.g.  $S_0 = 4$  for machine tools), the rolling element set is always the decisive criterion.

## Permissible static axial load for ZKLF

For bearings of series ZKLF, the permissible static axial load in the direction of the screw connections, *Figure 24*, is:

$$P_{0\text{per}} \leq \frac{C_{0a}}{2}$$

The basic static axial load rating  $C_{0a}$  is stated in the dimension tables.

*Figure 24*

Static axial load in the direction of the screw connections

## Design of adjacent construction

The adjacent construction (the shaft and housing) must be designed in accordance with the data in the dimension tables.

The abutment diameters for the shaft and housing shoulders  $d_a$  and  $D_a$  must be in accordance with the dimension tables.

$D_a$  and  $d_a$  are recommended minimum abutment diameters. If these values are not used, the rib diameter  $d_1$  according to the dimension table must be observed.

## Matched bearings

In matched bearing pairs of series ZKLN and ZKLF, the depth of the housing bore must be defined such that the outer ring of the outermost bearing is radially supported to at least  $\frac{1}{4}$  of its width.

## Speeds

The limiting speeds  $n_G$  given in the dimension tables are based on the following conditions:

- bearing preloaded, no external operating load
- operating duration 25%
- max. equilibrium temperature +50 °C.

Under favourable environmental influences, a bearing with gap seals (suffix 2Z) can be used instead of contact seals. The limiting speed of these bearings is approximately twice that of axial angular contact ball bearings with contact seals.

# Axial angular contact ball bearings

**Friction** In most applications, preloading of bearings by means of the locknut tightening torque gives sufficiently accurate setting values. The reference here is the tightening torque  $M_A$  according to the dimension table in conjunction with an INA precision locknut.

The frictional torque  $M_{RL}$  given in the dimension tables is a guide value. The frictional torques are based, for bearings of series ZKLN, ZKLF, ZKLFA, DKLFA, 7602..-2RS, 7603..-2RS, BSB..-2RS and ZKLR on grease lubrication, measured at a speed of  $n = 5 \text{ min}^{-1}$ .

For unsealed bearings of series 7602, 7603 and BSB, the frictional torque  $M_{RL}$  is based on lightly oiled raceways.

For dimensioning of the drive, the starting frictional torque and the frictional torque at high speeds of 2 to  $3 \times M_{RL}$  must be taken into consideration.

**Seal friction** In axial angular contact ball bearings with contact seals (suffix 2RS), the extent of seal friction must not be neglected. Sealing influences the limiting speeds.

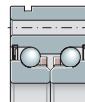

**Frictional energy** The frictional energy  $N_R$  of the bearings can be calculated as follows:

$$N_R = \frac{M_{RL} \cdot n}{9,55}$$

$N_R$  Frictional energy  
 $M_{RL}$  Bearing frictional torque  
 $n$  Operating speed.  
W Nm  $\text{min}^{-1}$

In any analysis of the thermal balance, the various operating speeds  $n_i$  and their corresponding time portions  $q_i$  must be taken into consideration.

<b>Lubrication</b>	Bearings for screw drives can be lubricated with grease or oil. In machine tools, however, the mean bearing temperature should not exceed +50 °C. If this is the case, a lubrication method without heat dissipation such as grease lubrication or oil impulse lubrication can be selected.  ! For higher bearing temperatures and open bearings, recirculating oil lubrication should be used.
<b>Grease lubrication</b>	Bearings with a relubrication facility of series ZKLN, ZKLF, ZKLFA and DKLFA are greased with a lithium soap grease to GA28 and are preferably run with grease lubrication. In most cases, the initial greasing is sufficient for the whole operating life of the bearing. Under certain application conditions, relubrication may be necessary. In this case, Arcanol MULTITOP is suitable. The initial greasing is compatible with greases with a mineral oil base.  For checking by calculation of the grease operating life or relubrication interval, please contact us.
<b>Relubrication interval</b>	The relubrication intervals cannot be determined precisely in advance. They are essentially dependent on the operating conditions and the environmental influences such as temperature, contamination, dust, water, etc.  ! Bearings must always be relubricated: <ul style="list-style-type: none"><li>■ before and after long stoppage periods</li><li>■ in conditions of high humidity</li><li>■ within the defined lubrication intervals as stated in the technical proposal letter.</li></ul> For the following conditions, please contact us: <ul style="list-style-type: none"><li>■ if the bearings are stationary</li><li>■ if vibration is present</li><li>■ if very small oscillating movements occur.</li></ul>
<b>Relubrication quantity</b>	If bearings of series ZKLN, ZKLF, ZKLFA and DKLFA must be relubricated due to the application conditions, please contact us regarding the relubrication quantities.
<b>Oil lubrication</b>	Other lubrication methods such as oil impulse lubrication or recirculating oil lubrication are also possible. For oil lubrication, good results have been obtained with oils CLP to DIN 51517 and HLP to DIN 51524 or ISO-VG 32 to ISO-VG 100.  If oil impulse lubrication is intended for series ZKLN and ZKLF, gap seals are advantageous. They prevent contamination entering the bearing and allow oil to leave the bearing. This prevents overlubrication.

# Axial angular contact ball bearings

## Mounting guidelines

Bearings should only be fitted and dismantled in accordance with the Fitting and Maintenance Manual TPI 100. This TPI is available upon request.

During fitting of bearings, mounting forces should be applied only to the bearing ring to be fitted. Mounting forces must never be directed through the rolling elements or sealing rings.

The characteristics of the bearings are only valid when used in combination with INA precision locknuts and the associated tightening torques given in the dimension tables.

Axial angular contact ball bearings are self-retaining and the individual bearing components are matched to each other. The inner rings must not removed from the bearing during fitting and dismantling. If individual bearing components are removed from the bearing, please contact us before carrying out any reassembly.

### Location of outer ring using ring nut for ZKLN, 7602, 7603, BSB

Axial angular contact ball bearings ZKLN, 7602, 7603 and BSB must be located clearance-free in the housing and on the shaft and must be axially preloaded during fitting. The axial preload force must be distributed evenly over the circumference in order to avoid deformation of the raceways.

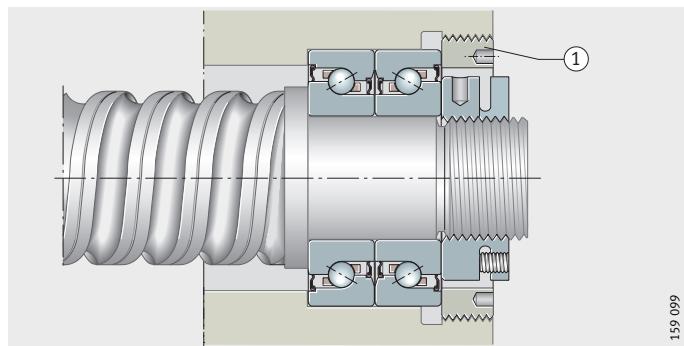

Outer rings are axially tensioned to the preload force given in the dimension table by means of a ring nut (not supplied), *Figure 25*. Secure the ring nut against loosening (using, for example, Loctite 638).

Ring nuts with a runout of max. 5  $\mu\text{m}$  apply the preload force evenly over the bearing rings and should therefore be used in preference to location by means of a cover.

ZKLN, 7602, 7603, BSB

① Ring nut

*Figure 25*  
Two-bearing set in O arrangement,  
locknut, ring nut

159 099

## Location of outer ring using a cover

Clamping of the outer rings using a cover and cap screws leads to deformation of the raceways, *Figure 26*. In order to minimise the deformation and achieve the calculated life:

- the cover should be designed with adequate rigidity
- the number of fixing screws should be selected in accordance with the load but at least four should be used
- the screws should be tightened in a cross-wise sequence in four stages (finger tight, 40%, 70%, 100% of  $M_A$ ).

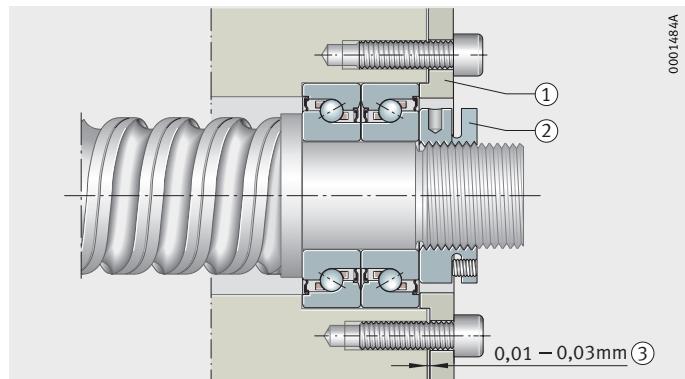

Observe the axial preload force in the dimension table. If other values are used, this will influence the bearing preload, bearing friction and heat generation in the bearing position.

*Figure 26*  
Two-bearing set in O arrangement,  
locknut, cover

# Axial angular contact ball bearings

## Location of inner ring using locknut

Axial angular contact ball bearings must be axially preloaded during fitting by means of a precision locknut.

When preloading the bearings by means of the bearing inner rings using the recommended precision locknut, the tightening torques given in the dimension tables must be observed.

The tightening torques for the individual bearing sizes are only valid for the INA precision locknuts listed.

The preload force for series DKLFA is determined specifically on the basis of the operating conditions (load spectrum). Please contact us.

In order to counteract settling, it is recommended that the locknut should initially be tightened to twice the tightening torque  $M_A$  and then relieved of load again. It should only then be tightened again to the stated tightening torque  $M_A$ . Finally, the precision locknut should be secured against rotation by the torque-controlled tightening of the grub screws.

The characteristics of the bearings are only valid if the preload forces specified in the dimension tables are observed.

The tightening torques for INA precision locknuts required for this purpose are also given in the dimension tables.

If other suitable locknuts are used, the manufacturer's guidance on calculation of the necessary tightening torque should be observed. Only locknuts with a minimum runout accuracy of the end face to the thread of 5  $\mu\text{m}$  should be used.

## Fixing screws

The fixing screws for the outer ring must be tightened in a crosswise sequence. They may be loaded up to 70% of their proof stress.

If the bearing outer ring is supported by an additional housing cover, it must be ensured that the fixing screws are sufficiently well dimensioned.

## Fitting of angular contact ball bearing units

Angular contact ball bearing units ZKLR require no additional pre-load after fitting. They can often therefore be located on the spindle simply by means of clearance-free clamping.

The type of axial location depends on the load to be supported. The adjacent construction can be a milled flat face or, if necessary, even an unmachined screw mounting surface without radial centring.

### Fitting

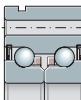

Locate the bearing unit using a locknut ① or clearance-free clamping on the threaded spindle ②, *Figure 27*.

Screw mount the bearing unit on the adjacent construction; tighten the screws only finger tight ③.

Move the screw drive nut ④ towards the bearing unit (the position of the screw drive is the datum for the linear guidance system, the nut serves as a functional element for alignment).

The bearing will align itself to the optimum radial position (due to the constraining forces exerted by the datum).

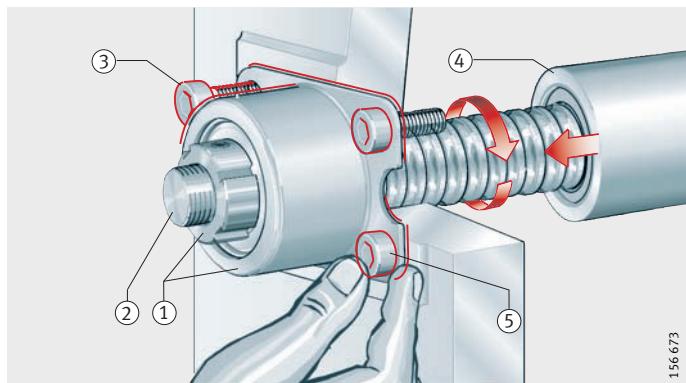

Screw the bearing unit to the adjacent construction using the tightening torque specified in the assembly drawing ⑤.

1) Tightening torque for the fixing screws as recommended by the manufacturer.  
Screws must be ordered separately.

2) Mass moment of inertia for rotating inner ring.

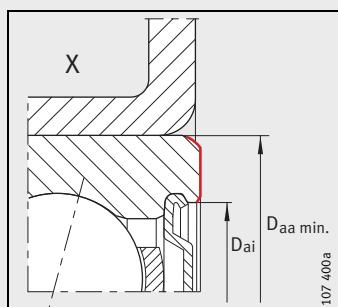

3) The locknut is only used to axially locate the bearing unit.  
It has no influence on the bearing preload.

4) Stated geometrical tolerances only required in diameter area between D<sub>ai</sub> and D<sub>aa</sub>.

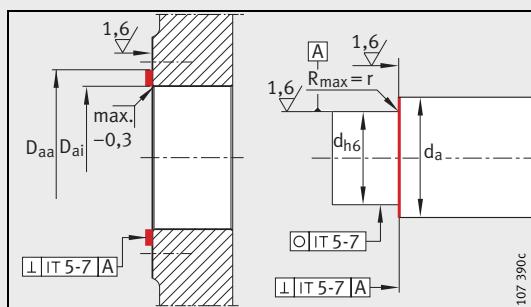

5) Only valid in conjunction with INA precision locknuts.

6) Statistically determined mean values from measurements on the complete bearing.

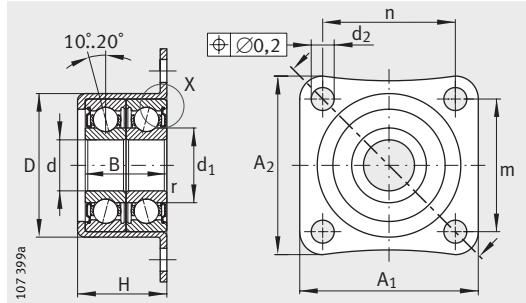

7) The axial runout data for screw drive bearing arrangements are based on the rotating inner ring.

ZARF..-L

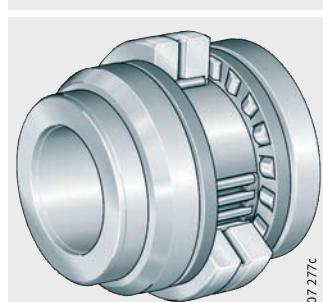

### Not for screw mounting

ZARN

With extended  
shaft locating washer

ZARN..-L

# Needle roller/ axial cylindrical roller bearings

## Features

Needle roller/axial cylindrical roller bearings comprise an outer ring with radial and axial raceways, shaft locating washers, an inner ring, a radial needle roller and cage assembly and axial cylindrical roller and cage assemblies. The bearings are available in versions for screw mounting and not for screw mounting.

## Radial and axial load carrying capacity

In addition to radial forces, the bearings can also support axial forces from both directions and tilting moments.

## Preload and internal clearance

The outer ring, inner ring and axial cages are matched to each other such that the bearing is axially clearance-free after preloading by means of an INA precision locknut.

The radial internal clearance is C2 according to DIN 620.

## Bearings for screw mounting

Needle roller/axial cylindrical roller bearings ZARF(L) have holes in the outer ring. These are used for screw mounting directly on the adjacent construction or in a radial locating bore, *Figure 1*.

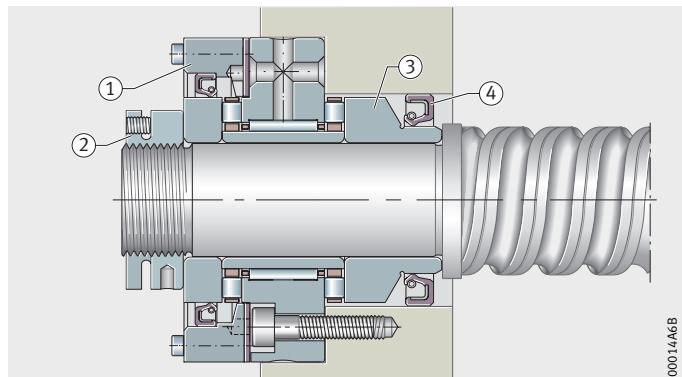

Due to screw mounting of the outer ring, the cover that would otherwise be required and the matching work can therefore be dispensed with. The bearings are preloaded against the shaft shoulder by means of a precision locknut AM or ZM(A).

## With seal carrier assembly

In the interests of a simpler design, a seal carrier assembly DRS, *Figure 1*, ①, is recommended. The seal carrier assembly is centred on the outer ring and seals the bearing against outside influences.

ZARF..-L

- ① Seal carrier assembly DRS
- ② Locknut
- ③ Stepped shaft locating washer
- ④ Sealing ring

*Figure 1*  
Stepped shaft locating washer  
with sealing ring

## With extended shaft locating washer

ZARF..-L has an extended and stepped shaft locating washer, *Figure 1*. These series are used in preference where the shaft locating washers are not adequately supported axially by the shaft shoulder or the bearing unit cannot be sealed on the outside surface of the normal shaft locating washer due to space conditions in the adjacent construction.

## Heavy series

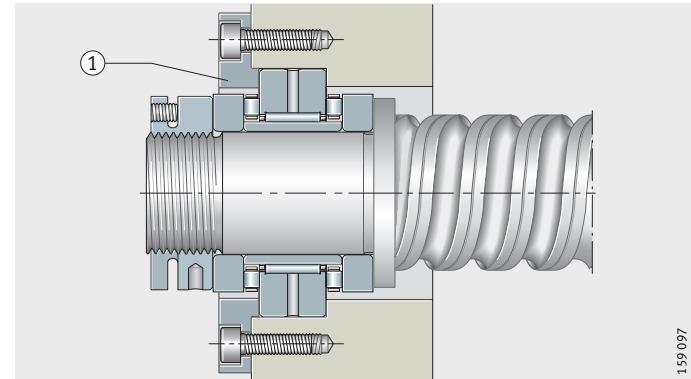

ZARF(L) is also available in a heavy series. This series has a larger cross-section for the same shaft diameter and therefore higher basic load ratings.

# Needle roller/ axial cylindrical roller bearings

## Bearings not for screw mounting

Bearings ZARN(L) are mounted in a housing bore and the outer ring is located using a cover, *Figure 2*. They are preloaded against the shaft shoulder by means of a precision locknut AM or ZM(A).

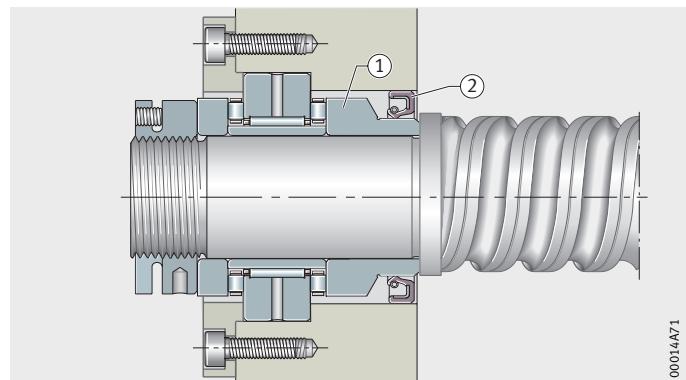

*Figure 2*  
Bearing outer ring  
located using cover

## With extended shaft locating washer

ZARN..-L has an extended and stepped shaft locating washer, *Figure 3*.

This series is used in preference where the shaft locating washer is not adequately supported axially by the shaft shoulder or the bearing unit cannot be sealed on the outside surface of the normal shaft locating washer due to space conditions in the adjacent construction.

*Figure 3*  
Stepped shaft locating washer with  
sealing ring

## Heavy series

ZARN(L) is also available in a heavy series. This series has a larger cross-section for the same shaft diameter and therefore higher basic load ratings.

## Operating temperature

The bearings are suitable for temperatures from -30 °C to +120 °C.

## Suffixes

Suffixes for the available designs: see table.

## Available designs

Prefix	Description	Design
L	Extended, stepped shaft locating washer	Standard
TV	Cages made from glass fibre reinforced polyamide 66	

## Design and safety guidelines

### Basic rating life

The decisive factors in determining the bearing size are the basic rating life, the static load safety factor and the axial limiting load. The basic rating life  $L$  and  $L_h$  are calculated as follows:

$$L_{10} = \left( \frac{C}{P} \right)^P$$

$$L_{10h} = \frac{16\,666}{n} \cdot \left( \frac{C}{P} \right)^P$$

$C_r, C_a$  N  
Basic dynamic radial or axial load rating according to dimension table

$P$  –  
Life exponent  $p = 10/3$ .

### Resultant and equivalent bearing load

The resultant axial bearing load  $F_{a\text{res}}$  is determined from the axial operating load  $F_{aB}$  and taking account of the axial preload, *Figure 4*, page 66, to *Figure 6*, page 66.

Under purely axial load,  $P = F_{a\text{res}}$ . If additional radial operating loads are present, these must be calculated separately using the radial basic load ratings. The limit values up to which the axial load can be supported without clearance are shown, *Figure 4*, page 66, to *Figure 6*, page 66.

A load in excess of the limit value will lead to the rolling element row without load lifting off the raceway. As a result, higher wear will occur under rapid acceleration. For extreme moment loads and statically overdefined systems (locating/locating bearing arrangements), please contact us. The calculation program BEARINX® can give a precise design in this case.

### Load varying in steps

In this case,  $P$  and  $n$  are calculated as follows ( $q$  = time portion %):

$$P = p \sqrt{\frac{q_1 \cdot n_1 \cdot P_1^p + \dots + q_z \cdot n_z \cdot P_z^p}{q_1 \cdot n_1 + \dots + q_z \cdot n_z}}$$

$$n = \frac{q_1 \cdot n_1 + \dots + q_z \cdot n_z}{100}$$

### Static load safety factor

The static load safety factor  $S_0$  is calculated according to (see also page 20):

$$S_0 = \frac{C_0}{P_0}$$

In machine tools,  $S_0$  should be  $\geq 4$ .

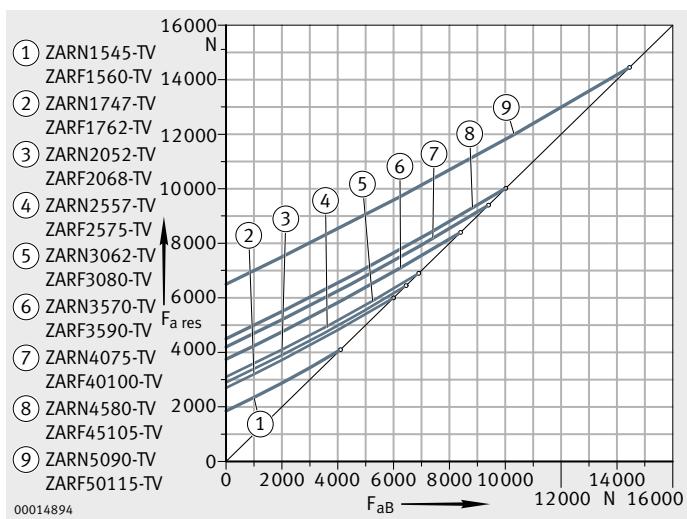

# Needle roller/ axial cylindrical roller bearings

Figure 6  
 Resultant bearing load  
 ZARN, ZARF,  
 heavy series from d = 55 mm

## **Design of adjacent construction**

The adjacent construction (the shaft and housing) must be designed in accordance with the data in the dimension tables.

The abutment diameters for the shaft and housing shoulders  $d_a$  and  $D_a$  must be in accordance with the dimension tables.

The permissible contact pressure for the adjacent construction must be observed.

Examples of possible lubricant feeds: see *Figure 7* and *Figure 8*, page 69.

## **Sealing of the bearing position**

The bearings are sealed, *Figure 1*, page 63:

- in the direction of the spindle by a rotary shaft seal on the outside surface machined free from spiral marks of the extended shaft locating washer (ZARN...L, ZARF...L)
- in the direction of the drive by the seal carrier assembly DRS.

## **Speeds**

The limiting speeds  $n_G$  given in the dimension tables are based on the following conditions:

- bearing preloaded, no external operating load
- operating duration 25%
- max. equilibrium temperature +50 °C.

The limiting speeds  $n_G$  are valid for oil lubrication with adequate cooling.

# Needle roller/ axial cylindrical roller bearings

**Friction** In most applications, preloading of bearings by means of the locknut tightening torque gives sufficiently accurate setting values.

The reference here is the tightening torque  $M_A$  according to the dimension tables in conjunction with an INA precision locknut.

The frictional torque  $M_{RL}$  given in the dimension tables is a guide value. It is based on lightly oiled bearings, measured at a speed of  $n = 5 \text{ min}^{-1}$ .

For dimensioning of the drive, the starting frictional torque and the frictional torque at high speeds of 2 to  $3 \times M_{RL}$  must be taken into consideration.

**Frictional torque and bearing preload**

For applications in which the frictional torque is decisive (for example temperature development, frictional torque compensation between different bearing positions, etc.), it is recommended that the bearing preload should be set in accordance with the bearing frictional torque  $M_{RL}$ .

**Frictional energy**

The frictional energy  $N_R$  of the bearings can be calculated as follows:

$$N_R = \frac{M_{RL} \cdot n}{9,55}$$

$N_R$  Frictional energy

$M_{RL}$  Bearing frictional torque

$n$  Operating speed.

W

Nm

$\text{min}^{-1}$

In any analysis of the thermal balance, the various operating speeds  $n_i$  and their corresponding time portions  $q_i$  must be taken into consideration.

**Lubrication**

Needle roller/axial cylindrical roller bearings can be relubricated via the outer ring. They are supplied with oil-based or dry preservative and should preferably be lubricated with oil.

Good results have been obtained with oils CLP to DIN 51 517 and HLP to DIN 51 524 or ISO-VG 32 to ISO-VG 100.

**Relubrication for grease lubrication**

Relubrication should be carried out with the bearing rotating and still warm from operation in order to achieve good replacement and distribution of grease.

The relubrication interval and quantity can only be determined under operating conditions since it is not possible to calculate all the influences in advance.

Relubrication: see INA Fitting and Maintenance Manual TPI 100.

Where a vertical axis of rotation is used in conjunction with automatic lubrication systems, the lubrication impulse should be selected such that the supply to the upper axial bearing is sufficient.

## Lubricant feed

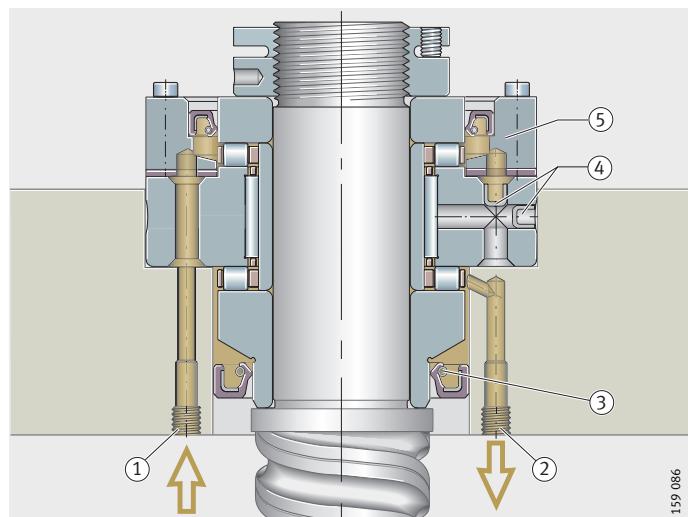

Examples of lubricant feeds for ZARF(L) are shown in *Figure 7*, *Figure 8*.

Before initial operation, it must be ensured that all raceways are adequately supplied with lubricant.

# Needle roller/ axial cylindrical roller bearings

## Mounting guidelines

Bearings should only be fitted and dismantled in accordance with INA Fitting and Maintenance Manual TPI 100. This TPI is available upon request.

During fitting of bearings, mounting forces should be applied only to the bearing ring to be fitted. Mounting forces must never be directed through the rolling elements.

The characteristics of the bearings are only valid when used in combination with INA precision locknuts and the associated tightening torques given in the dimension tables.

ZARN and ZARF are not self-retaining. The individual bearing components are matched to each other. The individual parts of different bearings must not be interchanged during fitting.

## Setting the axial preload

The preload in the axial component of ZARF(L) bearings is decisive for the function. It must therefore be set with sufficient accuracy.

Since direct force measurement of these values in fitting is not cost-effective, the axial preload is set indirectly using the following methods:

- either by means of the tightening torque  $M_A$  of the precision locknut. The frictional torque may deviate from the value given in the dimension table
- or by means of the bearing frictional torque  $M_{RL}$ .

## Preloading by locknut

Needle roller/axial cylindrical roller bearings must be axially preloaded during fitting by means of a precision locknut.

When preloading the bearing unit by means of the bearing inner rings using the recommended precision locknut, the tightening torques given in the dimension tables must be observed or the preload must be set using the bearing frictional torque given in the dimension tables. The tightening torques given for the individual bearing sizes are only valid for the INA precision locknuts listed.

In order to counteract settling, it is recommended that the locknut should initially be tightened to twice the tightening torque  $M_A$  and then relieved of load again. It should only then be tightened again to the stated tightening torque  $M_A$ . Finally, the precision locknut should be secured against rotation by the torque-controlled tightening of the set screws.

**Fixing screws** The fixing screws for the outer ring must be tightened in a crosswise sequence. They may be loaded up to 70% of their proof stress.

If the bearing outer ring is supported by an additional housing cover, it must be ensured that the fixing screws are sufficiently well dimensioned.

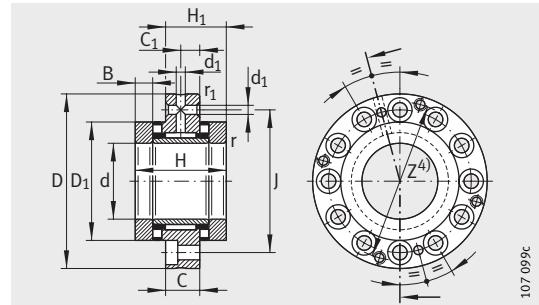

**Accuracy** Dimensional and geometrical accuracy (DIN 620):

- axial P4
- radial P6.

1) If rotary shaft seals are used, the outside diameter of the sealing ring must be taken into consideration.

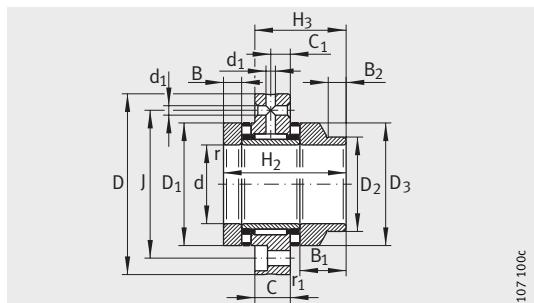

2) Tightening torque of fixing screws according to manufacturer's data.  
Screws are not included in the delivery.

3) Mass moment of inertia for rotating inner ring.

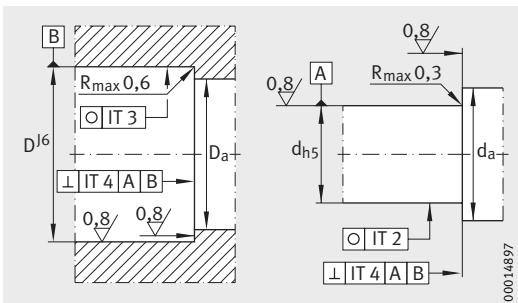

4) Mounting dimension for seal carrier assembly DRS.  
Seal carrier assemblies: see page 91 and page 97.

5) Only valid in conjunction with INA precision locknuts.

6) The axial runout data for screw drive bearing arrangements are based on the rotating inner ring.

## Seal carrier assemblies

DRS

## Precision locknuts For axial locking

AM

## For radial locking

ZM, ZMA

# Seal carrier assemblies

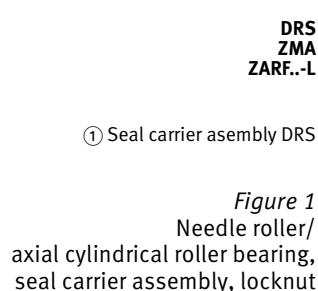

## Precision locknuts

### Features

#### Seal carrier assemblies

Seal carrier assemblies DRS are screw mounted to the outer ring of needle roller/axial cylindrical roller bearings ZARF(L) and precisely centred in this position, *Figure 1*, ①. They seal the bearings against outside influences.

The sealing elements are supplied as a complete kit and comprise a seal carrier with an integral rotary shaft seal, a gasket and hexagonal socket cap screws for fixing the carrier to the central washer of the bearing.

*Figure 1*  
Needle roller/  
axial cylindrical roller bearing,  
seal carrier assembly, locknut

#### Operating temperature

Seal carrier assemblies are suitable for operating temperatures from  $-30^{\circ}\text{C}$  to  $+120^{\circ}\text{C}$ , restricted by the seal material.

# Seal carrier assemblies

## Precision locknuts

### Precision locknuts

Precision locknuts are used where high axial forces must be supported and high runout accuracy and rigidity are required, *Figure 2, ①, Figure 3*, page 93, ①.

The thread and the axial face of the locknut in contact with the rolling bearing are produced in a single clamping operation. This allows very high runout accuracy to be achieved.

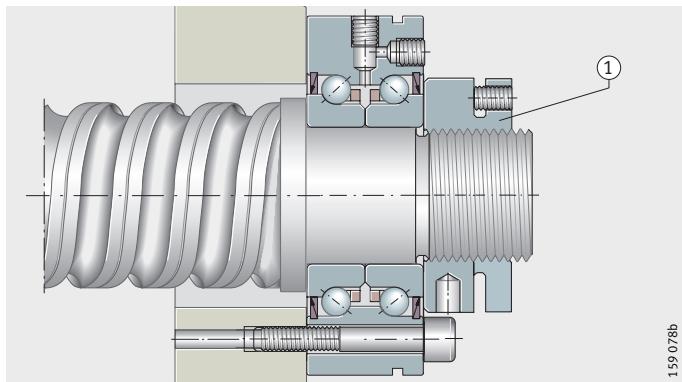

Locknuts are available in the designs AM, ZM and ZMA. If handled correctly, they can be reused several times.

### Axial locking by segments

Locknuts of series AM are divided into several segments for applying the locking forces. When the hexagonal socket grub screws are tightened, the segments are elastically deformed. As a result, the thread flanks of the segments are pressed against the flanks of the shaft thread and give a high frictional force that acts to prevent loosening of the nut. The runout of the nut is not affected by this method of locking.

AM  
ZKLF..-2RS  
① Precision locknut AM

*Figure 2*  
Axial angular contact ball bearings

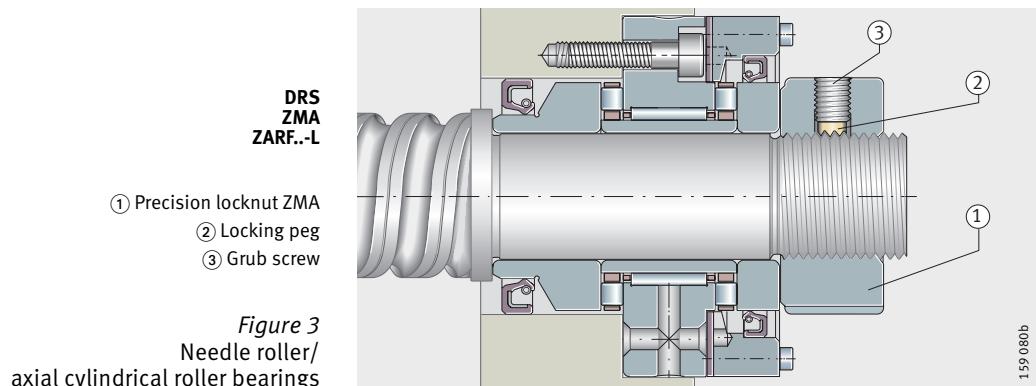

## Locking by radial locking pegs

Locknuts ZM and ZMA are secured against rotation by means of two radially acting locking pegs, *Figure 3*, ①. ZMA is the heavy series.

The locking pegs are manufactured together with the internal thread of the locknut. They mesh in the thread of the shaft without affecting the runout or damaging the thread, *Figure 3*, ②.

The locking pegs are secured by grub screws with a hexagonal socket arranged concentrically over the locking pegs, *Figure 3*, ③.

# Seal carrier assemblies

## Precision locknuts

### Design and safety guidelines

Shaft threads for the precision locknuts must be precision machined, see table.

#### Recommended shaft thread

Shaft thread	
Tolerance class “medium”	Tolerance class “fine”
6g DIN 13 T21-24	4h DIN 13 T21-24

The journal thread must support the locknut over its whole width.

#### Breakaway torque

The breakaway torques  $M_L$  given in the dimension tables are based on a locknut tightened against a rigid shaft shoulder to the reference tightening torque  $M_{AL}$  and secured.

#### Ultimate axial load

The axial ultimate loads  $F_{aB}$  are valid for a journal thread with a tolerance 6g or better and a minimum strength of 700 N/mm<sup>2</sup>. For dynamic loading, the permissible value can be taken as 75% of the ultimate load  $F_{aB}$ .

#### Fitting and dismantling

For the fitting and dismantling of bearings and precision locknuts, the information in the INA Fitting and maintenance manual, TPI 100 must be observed.

Locknuts must be fully screwed onto the shaft thread.

### Precision locknuts with axial locking

Locknuts AM can be tightened using a hook wrench to DIN 1810B that engages in four, six or eight holes around the circumference.

The grub screws are then tightened in a crosswise sequence to the specified tightening torque  $M_A$  using an Allen key.

Dismantling is carried out by uniformly loosening the grub screws of all segments in order to prevent a single segment being left tensioned.

Tightening by means of just one segment is not permissible.  
For tightening, an adapter of series AMS can be used that ensures uniform loading of all segments. The adapter AMS must be ordered separately, see dimension table, page 99.

For tightening using the adapter AMS, a hook wrench to DIN 1810A or to DIN 1810B can be used.

If precision locknuts AM are fitted using the adapter AMS, a maximum tightening torque of twice the value given in the dimension table for the bearing is permissible.

Segments can be axially deformed if the grub screws are not tightened uniformly in a crosswise sequence or the locknut AM is not fully screwed onto the shaft thread. The specified tightening torque  $M_A$  according to the dimension table must be observed.

# Seal carrier assemblies

## Precision locknuts

### Precision locknuts with radial locking

Locknuts ZM and ZMA can be tightened using a hook wrench to DIN 1810A that engages in one of the four slots around the circumference.

The two grub screws are then tightened alternately to the specified tightening torque  $M_A$  using an Allen key; for  $M_A$ , see dimension tables for the bearings.

For dismantling, the two grub screws are first loosened and the locking pegs loosened by light impacts with a plastic hammer on the outside surface of the locknut (in the vicinity of the screw holes).

The locknut can then be easily unscrewed without damaging the journal thread.

### Accuracy

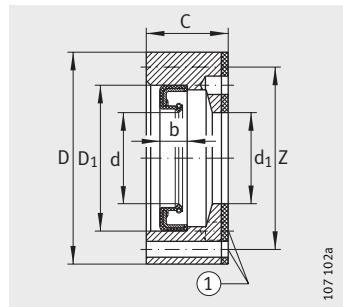

Accuracy of precision locknuts, see table.

### Axial runout

	Axial runout of face to thread <sup>1)</sup> μm	Metric ISO thread “fine”
	5	5H, DIN 13 T21-24

<sup>1)</sup> The face and thread are machined in a single clamping operation in order to achieve the highest accuracy. Before measurement, the precision locknut is clamped on a threaded mandrel with a defined tightening torque against a rigid shoulder. The grub screws are left untightened.

1) The seal carrier assembly is supplied as a kit comprising:

- seal carrier
- rotary shaft seal
- flange seal
- socket head screws.

2) Four holes offset by 90°.
