

High Durability NSK Water Pump Bearings

- High durability for powerful engines
- High reliability through a newly developed water resistant seal
- Improved grease

*High durability NSK water pump bearings support the advancement of engines.
These reliable bearings have three times greater durability than previous bearings.*

The pace of recent developments in automobiles is accelerating. A good example is the recent trend toward much more powerful and efficient engines, which are the hearts of automobiles. As a result, there is an increasing need for higher performance water pump bearings. We have thoroughly examined the various parts of water pump bearings to improve NSK designs in terms of high load durability as well as high resistance to heat, load and water. As a result, NSK has developed water pump bearings with higher performance. These improved bearings are the NSK high durability water pump bearings. We would like to introduce you to the outstanding features of these bearings, such as their newly developed water resistant seals, and the adoption of improved grease and materials.

Types and Features

Types

Water pump bearings come in two types. One is a Ball-Ball type (BWF) and the other is a Ball-Roller type (RWF). The Ball-Roller type design offers a much higher radial load capability of the roller row, which is particularly important when supporting either a fan or a relatively high off-set belt load.

Features

- Newly developed water resistant seals offer five times greater durability.**

NSK has developed brand-new water resistant seals. As a result, the durability under wet conditions is increased over five times.

- A better grease <WPH> was developed.**

NSK has developed an improved grease for water pumps. It is superior in terms of resistance to water, heat, and rust.

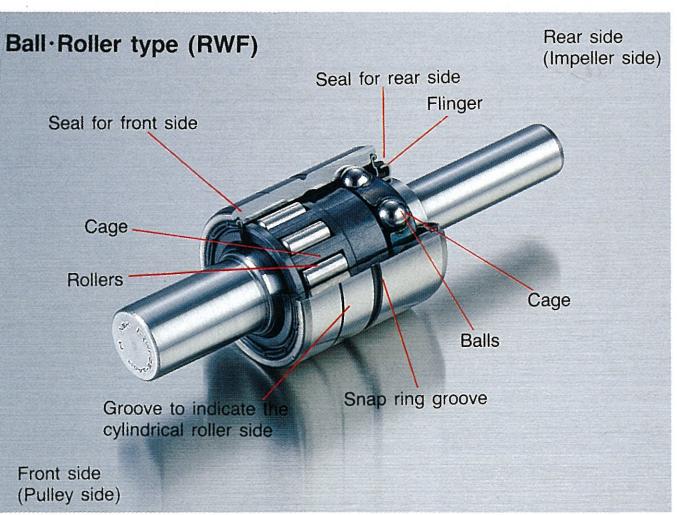

- Longer life is achieved by adoption of a new steel material.**

The new steel is a low oxygen and high cleanliness steel which has a life three times longer than common bearing steels. Also, the steel is carburized to achieve a much longer life.

Ball-Ball type (BWF)

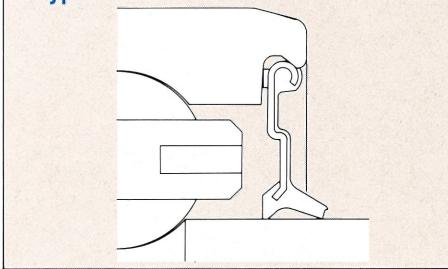

Ball-Roller type (RWF)

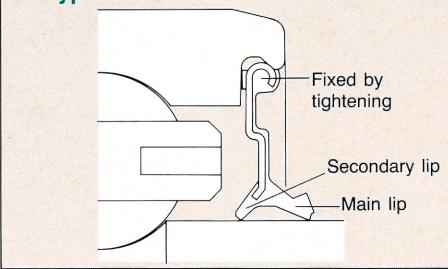

Properties

Any water (or water + coolant) entering through the mechanical seal may adversely affect the water pump bearing's effectiveness. If water enters into the bearing, surface fatigue occurs more rapidly due to insufficient oil film formation. Consequently, the bearing life decreases sharply. Therefore, it is very important to prevent water penetration to achieve full bearing life. <High durability water pump bearings> are so named for their high durability and reliability.

R type seals

HR type seals

WHR type seals

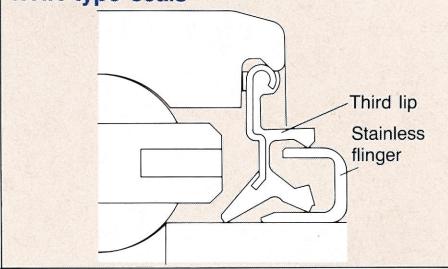

Fig. 1 Kinds of seals

- Seals**

- <R type seals>**

Since rubber seals tightly hug the outer ring recess, water penetration from the outside is prevented completely. A double-lip type seal is adopted, so that water penetration and grease leakage can be minimized.

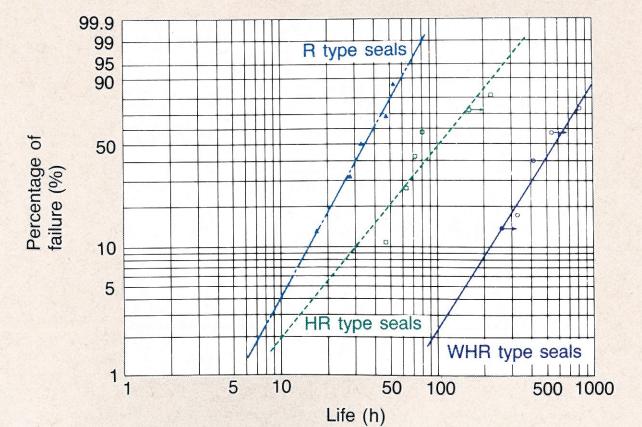

- <HR type seals>**

The water resistance of the main lips is increased beyond the degree of R type seals. Also, the HR type seal provides improved sealing in environments of engine vibration and unbalanced runout vibration.

- <WHR type seals>**

The third lip and flinger prevent water penetration remarkably well. The slinger prevents seal wear generated by a rusty surface, thereby increasing reliability.

Fig. 2 Percentage of failure of seals under NSK's accelerated testing conditions

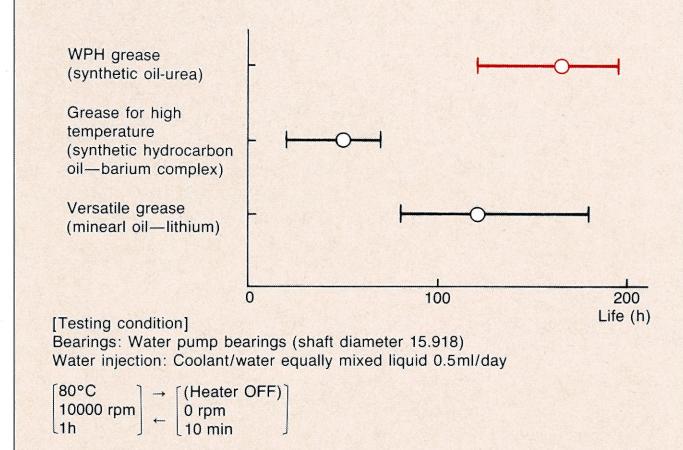

- Grease (WPH grease)**

The recent trends toward more powerful and efficient engines require better grease which has higher resistance to heat, load and water. NSK's WPH grease was developed to answer these demands.

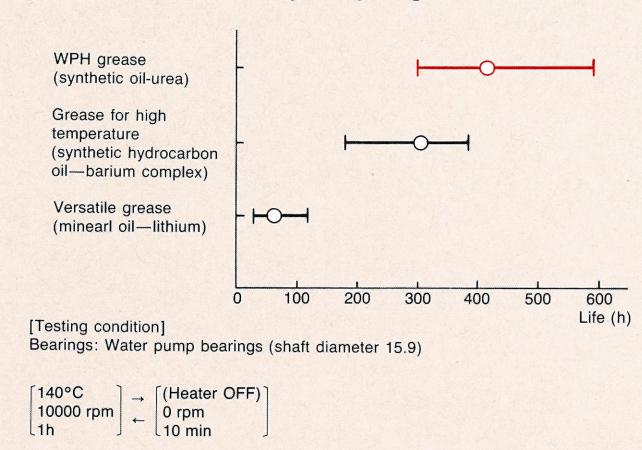

1. The thickener is a urea compound, which ensures proper lubrication for long periods because of its resistance to water and temperature effects.

Fig. 3 Water resistance capability of greases

2. The base oil of WPH is poly-alpha-olefin, which has high anti-oxidation capability and high heat stability. These characteristics result in excellent resistance to grease deterioration and bearing seizure at elevated bearing temperatures.
3. WPH has been shown to be excellent for rust prevention.

Fig. 4 Heat resistance capability of greases

Design and Manufacturing

- NSK high durability water pump bearings incorporate NSK's technology in their design and manufacturing.
- Rollers in the bearings are crowned, thus avoiding edge loading even under an off-set load which would otherwise cause large misalignment. (See Fig. 5 and Fig. 6)

Fig. 5 Distribution of roller surface pressure for general bearings

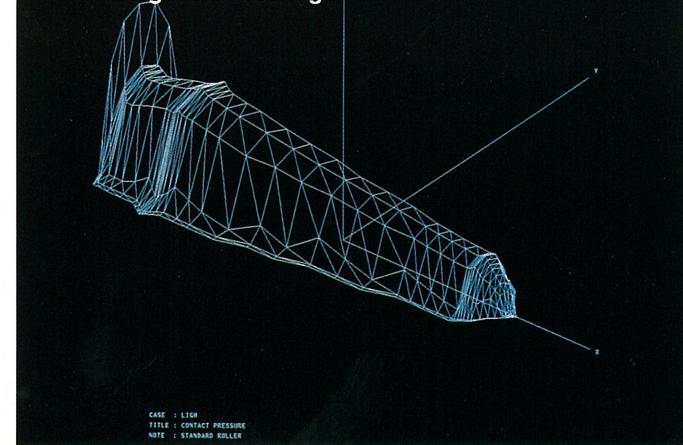

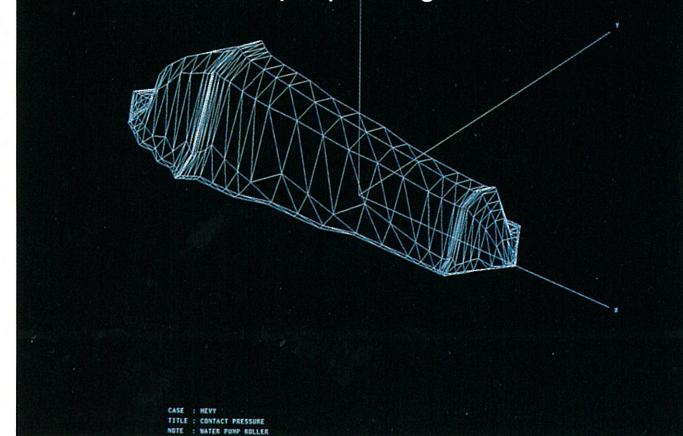

Fig. 6 Distribution of roller surface pressure for NSK water pump bearings

- NSK water pump bearings are designed to minimize stress concentration and are produced without distortion, to maintain the high strength required in certain applications such as those with cooling fan resonance or excessive belt tension. (See Fig. 7)

Fig. 7 An example of FEM analysis of shaft stress distribution

*When using water pumps with cooling fan clutches, NSK recommends the selection of one of the lower resonant bearings which were originally developed by NSK for fan clutches.

- Each chamfer is designed for ease of assembly and to avoid generating an unbalanced load.

Technical specification and bearing number system

Technical specification

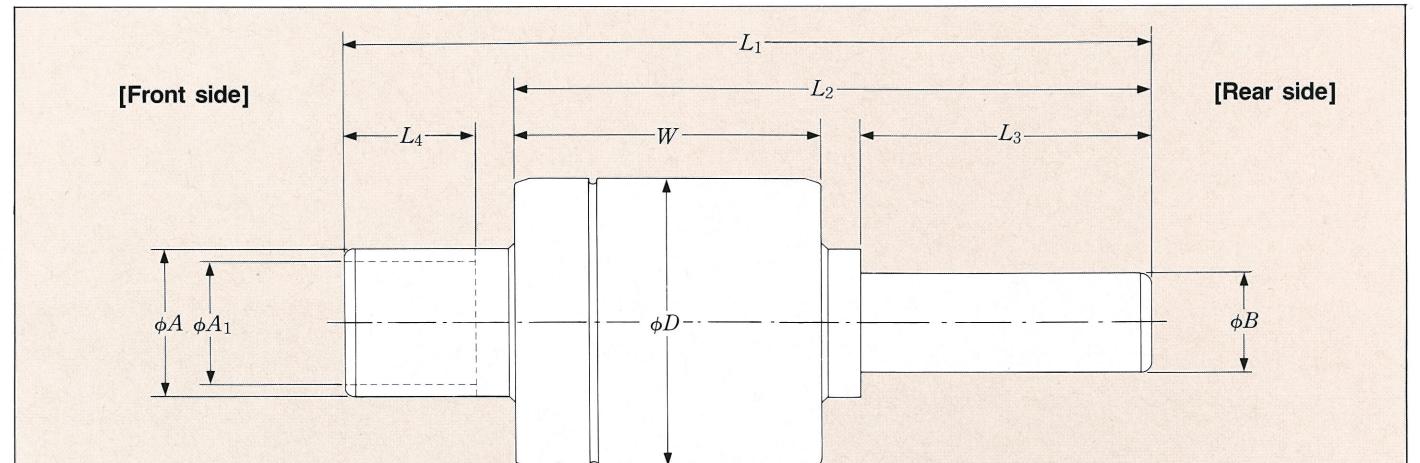

(1) Calculation of rating fatigue life

Suppose a number of bearings of the same type are operated individually under the same conditions. After a certain period of time, 10% of them fail as a result of flaking caused by rolling fatigue. In this case, the total number of revolutions is defined as the rating fatigue life, or if the speed is constant, the rating fatigue life is often expressed by the total number of operating hours completed at the time when 10% of the bearings become inoperable due to flaking. It can be calculated by using the equation on the right.

If the amount of the load's off-set is large, it is necessary to investigate and consider the incline of shafts, as well as the effect of the edge load. In such cases please consult NSK.

(3) Accuracy

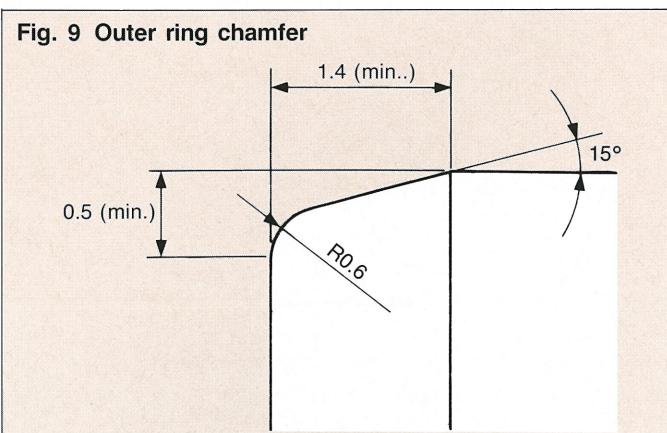

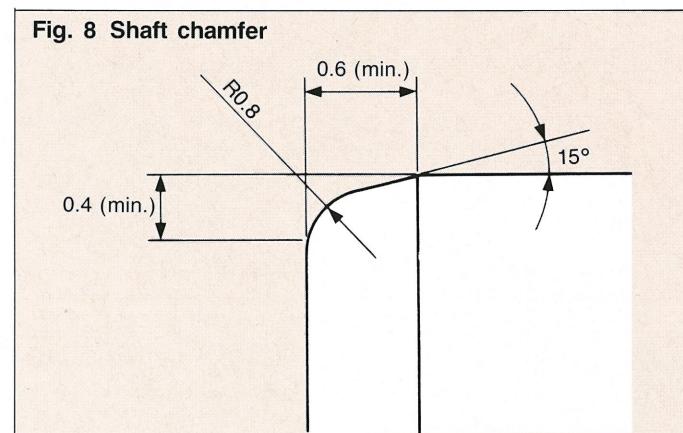

Both Ball-Ball type and Ball-Roller type of water pump bearings have the same dimensional tolerances as outlined below.

Types of bearings	Tolerance of outside diameter of outer ring D									
	high	low	high	low	high	low	high	low	high	low
RWF	0	-13	+150	-150	0	-13	0	-13	+250	-250
BWF	All dimensions								+250	-250
									+150	-150

(4) Dimensions of chamfers

Standard chamfer designs and dimensions of NSK water pump bearings are as follows:

(2) Standard design dimensions

Standard design dimensions of both Ball-Roller type and Ball-Ball type water pump bearings are described from page 7 to page 10. If other dimensions are required, please consult NSK.

Calculation of rating fatigue life

$$\text{Ball bearings} \quad L_h = \frac{10^6}{60n} \left(\frac{C}{P} \right)^3$$

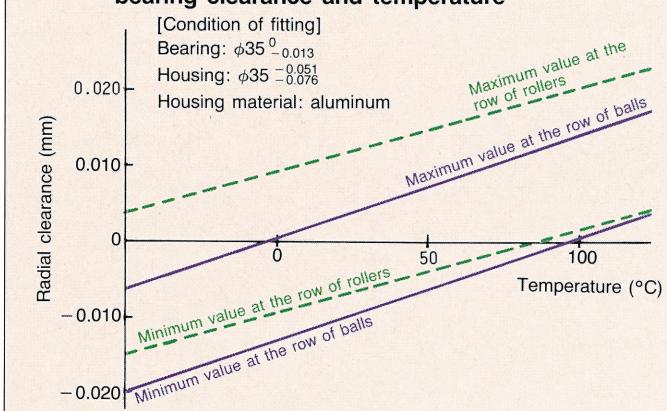

$$\text{Roller bearings} \quad L_h = \frac{10^6}{60n} \left(\frac{C}{P} \right)^{10}$$

where
 L_h : Rating fatigue life (h)
 P : Bearing load (N) {kgf}
 C : Basic load rating (N) {kgf}
 n : Bearing speed (rpm)

(5) Internal bearing clearances

The internal clearance in rolling bearings in operation greatly influences bearing performance in terms of fatigue life, vibration, noise, heat-generation, etc. Consequently, the selection of a proper internal clearance is one of the most important tasks. Theoretically, the longest bearing life can be expected when the clearance is slightly negative. However, it is difficult to achieve such an ideal condition, and an excessive negative clearance will greatly shorten the bearing life. Therefore, a clearance of zero or a slightly positive amount, instead of a negative one, should be selected in general. The clearance of water pump bearings is normally selected within the range between 0.010 mm—0.040 mm, but it may be necessary to change this range depending on the interference, rigidity, material, and temperature of the housing. Please consult NSK for further information on this topic.

Fig. 10 Water pump bearings correlation of internal bearing clearance and temperature

(6) Mounting

The mounting of bearings deserves careful attention, because the entry of dust and debris on bearing raceways or rolling elements can cause excessive noise, vibration and premature failure. Also, proper tools and assembly techniques should be used to prevent the transmission of forces between the bearing shaft and the outer ring.

Fig. 11 Pressing bearing into housing

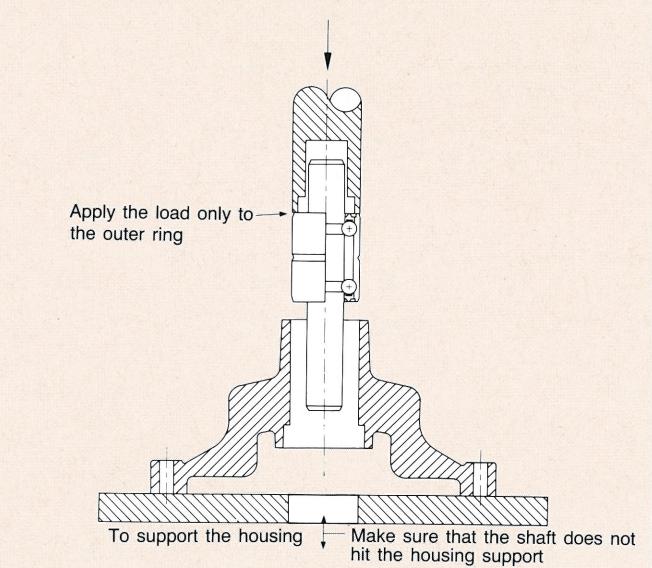

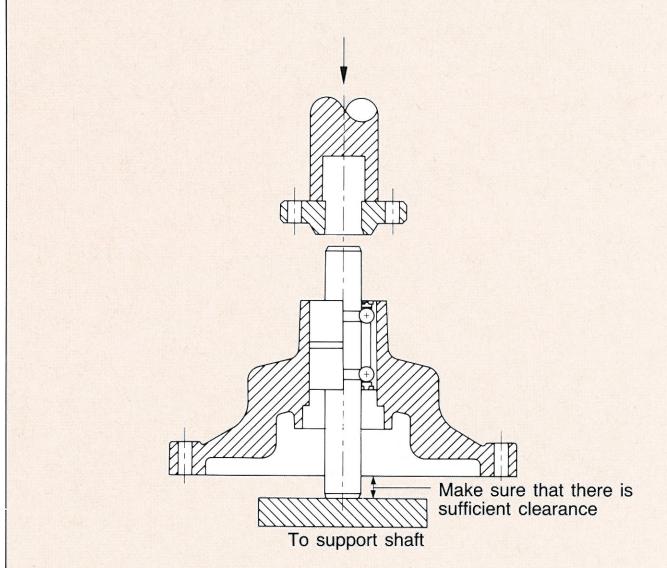

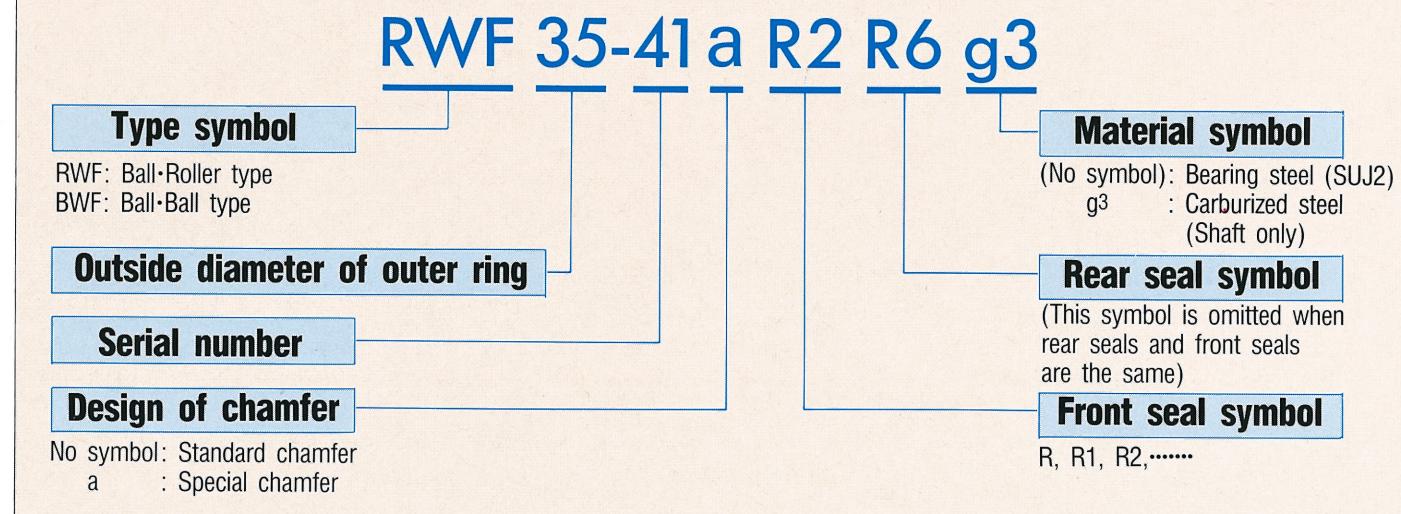

Fig. 12 Pressing hub onto shaft of mounting bearing

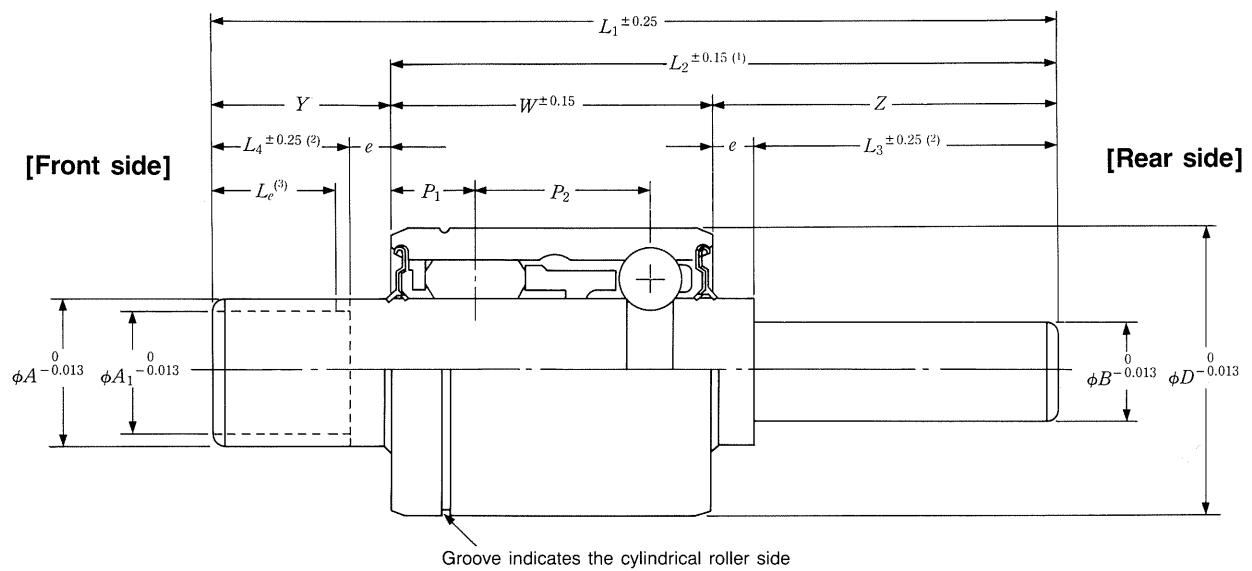

Bearing numbering system

The water pump bearing numbering system is outlined in Fig. 13. The dimensions for each bearing number are shown in the design tables on pages 7 to 18.

Fig. 13 Formulation of bearing numbers

Notes (1) The assembled width (L_2) is considered to be the standard dimension for specifying a design. As shown in the figure, the assembled length (L_2) is the distance between the front end face of an outer ring and the rear end face of a shaft. Please contact NSK, if you want to use a different dimension to specify a design. The tolerance of the assembled width (L_2) refers to the case when there is no axial clearance.

(2) The standard shaft length of the front side (L_4) or that of the rear side (L_3) is obtained by subtracting the protrusion of the stepped part (e) from the shaft protrusion (front: Y; rear: Z).

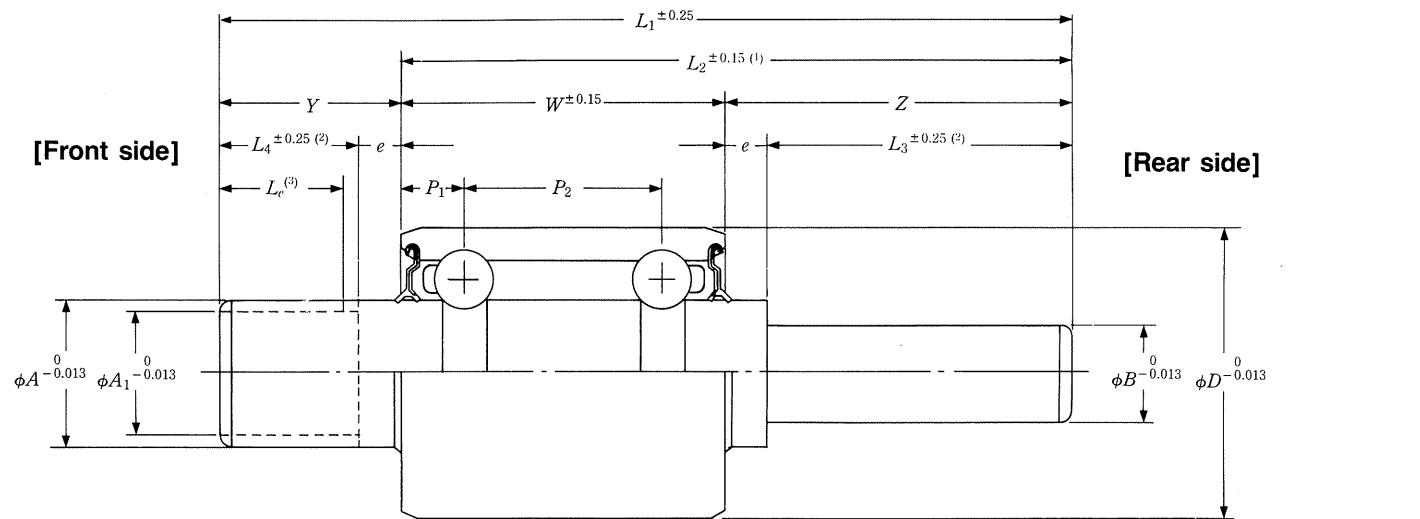

(3) The effective shaft length of the front or rear side (L_e : the length which can assure the tolerance of the shaft diameter) is obtained by subtracting 2.5 mm from the shaft length (from: L_4 ; rear: L_3).

(4) The shaft length (L_1), the shaft protrusion of the front side (Y), and the shaft protrusion of the rear side (Z) show their maximum dimension. When you need a dimension larger than these values, please contact NSK.

(5) The protrusion of the stepped part (e) shows the minimum length necessary to prevent seals from touching the stepped part.

Remarks When other dimensions than those shown here are necessary, please contact NSK. For actual results of manufacture, please refer to page 11 to page 14.
